Geosyntec Project Number SC1029

February 2020

EXECUTIVE SUMMARY

This Executive Summary presents the results of the Phase I Environmental Site Assessment (ESA) performed by Geosyntec Consultants (Geosyntec) for an approximately 136-acre property located on Olympic Parkway in Chula Vista, California. The subject property includes two contiguous parcels currently identified by the San Diego County Assessor's Office as parcel nos. 644-011-06-00 & 644-020-11-00 (the Site; Figures 1 and 2). This Phase I ESA was prepared in accordance with Geosyntec's 20 December 2019 scope of work. Geosyntec understands this Phase I ESA may be used to identify potential Recognized Environmental Conditions (RECs) associated with the property.

The objective of performing this Phase I ESA in accordance with ASTM International Standard E 1527-13 was to identify, to the extent feasible, "Recognized Environmental Conditions" (RECs) at the Site as the "REC" term is defined by ASTM E 1527-13. This REC definition eliminates from consideration several conditions that could fall under the general definition of "environmental issues" and focuses on known or potential releases of hazardous substances and petroleum products.

FINDINGS AND OPINIONS

The Site is situated on a hillside and slopes steeply from the south down to a permitted wetland along the northern boundary of the Site, parallel to Olympic Parkway. This wetland drains through a series of culverts and discharges from the northwest corner of the Site. Several panels of concrete are near the culverts and appear to assist with surface water drainage. There are no buildings on the Site, and several footpaths traverse the Site. Seven gas probes, three vadose monitoring wells, and two monitoring wells currently exist on the Site (Figure 2). Monuments and vaults labeled "CP Test" and believed to be associated with a recycled water pipeline which traverses the Site were also observed. The Site is bounded by chain-link fencing along the southern perimeter, which partially extends along the eastern border. Several chain-link gates are located at vehicle access locations from Olympic Parkway on the north side of the Site.

The Site has been historically vacant and undeveloped. The Site remains vacant and undeveloped, and it is Geosyntec's understanding that the planned future Site use includes development of a portion of the Site for residential use.

Properties in the Site vicinity have historically been used for bentonite (clay) mining, landfilling, and other industrial, commercial, and residential purposes. The Site is bounded to the north by Olympic Parkway; directly north of this is an undeveloped hillside, followed by residential subdivisions. Portions of the Otay Annex Sanitary Landfill adjoin the property to the southeast, and the property directly east of the Site is vacant and undeveloped. The Otay Annex Sanitary Landfill, also known as the Otay Class III landfill, extends west and also adjoins the Site to the south and surrounds the adjoining Otay Class I Landfill. Residential developments are situated southwest and directly west of the Site, and east and south of the Otay Class III landfill. Both the Class I and Class III landfills have groundwater monitoring networks which are monitored semiannually under orders issued by the San Diego Regional Water Quality Control Board.

Groundwater flow at both landfills is generally to the south-southwest away from the Site, and there are no indications of groundwater impacts beneath the site attributable to the two adjoining landfills. The Class III landfill is equipped with a landfill gas control system (LFGCS) and a perimeter probe monitoring network which is routinely monitored under the direction of the County of San Diego Local Enforcement Agency. Methane has not been detected above 1% by volume at the perimeter probes closest to the Site.

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-13 of the Site which encompasses approximately 136 acres located on Olympic Parkway in Chula Vista, California. The Phase I ESA performed by Geosyntec revealed no evidence of recognized environmental conditions in connection with the property, except for the following:

Historical investigations performed in the 1990s to assess potential impacts to the Site from the adjoining landfill properties identified subsurface methane which had migrated beneath the Site from the Class III landfill at concentrations up to 3,300 parts per million (ppm) methane, which is more than an order of magnitude lower than the lower explosive limit (LEL) of methane (50,000 ppm, or 5% by volume). To address the absence of recent soil vapor data for the site, a limited soil vapor investigation was conducted at the Site in January 2020 to evaluate current onsite subsurface soil vapor conditions and potential subsurface impacts attributable to the adjoining Otay Class III landfill. The soil vapor investigation documented methane was not detected in the samples, indicating that the LFGCS is effectively controlling the migration of methane from the adjoining Class III landfill. Low-level concentrations of VOCs were detected in soil vapor samples collected at the site, including four analytes detected in one or more samples at concentrations at concentrations above their respective Tier 1 ESLs or EPA RSLs for a residential site scenario. However, none of these analyte concentrations exceeded calculated DTSC-SLs for future residential construction. Therefore, with the understanding that the adjoining Class III landfill owner/operator will continue to operate the LFGCS in accordance with Title 27 requirements, future earth-moving activities in preparation for site development and construction will likely result in dissipation of residual VOC concentrations in shallow soil vapor, and future structures will be constructed using modern building practices with competent concrete slabs, there is no apparent unacceptable risk to future residential site occupants due to methane and/or VOC-impacted soil vapor.

De Minimis Conditions

De minimis conditions are environmental conditions which generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of the appropriate governmental agencies. Conditions determined to be *de minimis* are not RECs. *De minimis* conditions identified at the Site include debris and several pieces of discarded furniture, including a couch and a mattress, observed at the Site.

1 INTRODUCTION

This report documents the results of the Phase I Environmental Site Assessment (ESA) performed by Geosyntec Consultants (Geosyntec) for an approximately 136-acre undeveloped property located on Olympic Parkway in Chula Vista, California, including two contiguous parcels currently identified by the San Diego County Assessor's Office as parcel nos. 644-011-06-00 & 644-020-11-00 (the Site). This Phase I ESA was prepared for Sheppard Mullin, Richter & Hampton LLP (Sheppard Mullin) on behalf of Lennar Home of California (Lennar) in accordance with Geosyntec's 20 December 2019 scope of work. This report incorporates, by reference, the ASTM International (ASTM) Standard E 1527-13, "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process." Exceptions and limitations are provided in Section 1.5 of this report. Geosyntec performed the Phase I ESA for the sole use of its client, Sheppard Mullin and Lennar, as described in Section 1.6 of this report.

1.1 Purpose

The purpose of this Phase I ESA was to identify, to the extent feasible, "Recognized Environmental Conditions¹" (RECs) at the Site as the term "REC" is defined by ASTM E 1527-13. This REC definition eliminates from consideration several conditions that could fall under the general definition of "environmental issues" and focuses on known or potential releases of hazardous substances and petroleum products. Geosyntec understands this Phase I ESA may be used to help identify potential environmental liabilities associated with the property.

1.2 Site Description

The Site is located southeast of the intersection of Olympic Parkway and Brandywine Avenue within a mixed use area (Figures 1 and 2). The Site is comprised of approximately 136.15 acres on two contiguous parcels of undeveloped land and is owned by ACI Sunbow.

1.2.1 Site Characteristics

The Site is currently accessed from the northern boundary along Olympic Parkway. There are no structures on the Site, and the northern and western perimeters are intermittently delineated by landscaping and some fencing and gates. The eastern border is partially delineated by chain-link fencing between the Site and the adjoining Otay Sanitary Landfill Annex, and is fully delineated to the south by fencing. The Site is heavily vegetated with a topographic gradient to the north, sloping down to a stream and low-lying area that appears to be a continuation of the Poggi Canyon Stream.

_

¹ As defined by ASTM E 1527-13, a Recognized Environmental Condition is: "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. *De minimis* conditions are not recognized environmental conditions."

1.2.2 Surrounding Land Uses

A summary of pertinent nearby land uses is provided below:

- North: Olympic Parkway, followed by vacant, undeveloped land and residential developments
- South: Residences, vacant vegetated land, the Otay Annex Sanitary Landfill, and the Otay Class 1 Landfill
- East: Vacant land and the Otay Annex Sanitary Landfill.
- West: Residential developments and Brandywine Avenue

1.3 Geologic and Hydrogeologic Summary

The Site is located in the Peninsular Range geomorphic province (Google Maps: California Geomorphic Province Areas). The Site is directly underlain by the San Diego Formation, followed by the Otay Formation and the Mission Valley (Sweetwater) Formation (Geosyntec, 2006). The San Diego Formation consists of Pliocene-aged conglomerate and marine sandstone. According to the Updated Soils and Geologic Investigation for the Site and its addendum, bentonitic clay and claystone are encountered in shallow soils at the Site (GeoCon, 1999). The Otay Formation consists of marine or shallow bay deposits of mudstone, silt, sand, thin gravel layers, and volcanic ash; this volcanic ash has been altered to bentonite clay in some areas, including the footprint of the landfill to the south. Some areas of this formation have been disturbed by soft sediment deformation (slumping). The Mission Valley/Sweetwater Formation consists of clay and claystone with sand, silt, and gravel beds. The topographic gradient of the Site is to the north, with large native hills in the southern portion sloping down to the streambed along the northern perimeter. The elevation at the Site ranges from approximately 220 to 450 feet above Mean Sea Level (AMSL; Google Earth).

The Site is located in the Otay Hydrologic Area of the Otay Hydrologic Unit (RWQCB, 1998). At the nearby Otay Class I Landfill to the south, groundwater levels are routinely gauged; according to the most recent groundwater monitoring report for the Otay Class I landfill performed in July 2019, depth to groundwater in the perched zone ranged from 79.09 feet below ground surface (ft bgs) to 168.54 ft bgs and flowed to the south in the northern portion of the landfill (adjacent to the Site to the south) and to the north-northeast in the central and southern portion of the landfill. Groundwater in the intermediate aquifer was encountered from 232.89 ft bgs to 313.02 bgs and flowed to the south-southwest. Recent increased groundwater elevations in a perched zone well in the southern portion of the landfill resulted in a reversal of the perched groundwater flow from southwesterly to north-northeasterly. Groundwater in the intermediate aquifer flow shifted to the southwest due to groundwater increasing in a well along the eastern boundary; previously, groundwater flow has been to the west (Geosyntec, 2019).

1.4 Scope of Services

On 20 December 2019, Geosyntec was authorized by Mr. David Shepherd of Lennar to complete a Phase I ESA of the Site. The scope of services included the following:

- Searching standard local, state, and federal environmental record sources within recommended ASTM search distances;
- Reviewing available physiographic information including topographic, geologic, and hydrogeologic information;
- Reviewing historical aerial photographs;
- Reviewing historical fire insurance maps;
- Performing a Site reconnaissance;
- Conducting an interview with the client or client representative; and
- Documenting the procedures, findings, opinions, and conclusions of the Phase I ESA in this report.

This work was completed in general accordance with ASTM Practice E 1527-13 with the limitations and exceptions described in Section 1.5 of this report. For the purposes of this Phase I ESA report, Sheppard Mullin and Lennar represents the "user," defined as "the party seeking to use Practice E 1527-13 to complete an *environmental site assessment* of the *property...*"

This ESA report was prepared by Ms. Rosemary Propst and reviewed by Mr. Veryl Wittig, PG, CHG ("environmental professional," as defined under the ASTM Practice E 1527-13) of Geosyntec, in accordance with the peer review policy of the firm. Mr. Wittig's professional qualifications are presented in Appendix A.

1.5 <u>Limitations and Exceptions</u>

This Phase I ESA was performed according to the agreed upon scope of work with Sheppard Mullin and Lennar. This Phase I ESA is intended to reduce, but not eliminate, uncertainty regarding the potential for recognized environmental conditions in connection with the Site, and recognizes reasonable limits of time and cost. Not every property warrants the same level of assessment. Consistent with good commercial or customary practice, the appropriate level of assessment was guided by the type of property subject to assessment and the information developed in the course of the inquiry. A balance between the competing goals of limiting cost and time demands and the reduction of uncertainty about unknown conditions resulting from additional information was identified during the Phase I ESA.

Additional services considered optional by ASTM E 1527-13, such as asbestos-containing building materials, radon, lead-based paint, lead in drinking water, wetlands, regulatory compliance, cultural and historic resources, industrial hygiene, health and safety, ecological resources, endangered species, indoor air quality, biological agents, and mold were not included in the scope of work.

Geosyntec^o

consultants

The findings and conclusions presented in this Phase I ESA are the result of professional interpretation of the information collected at the time of this study. This Phase I ESA was not an exhaustive search of all available records, nor does it include detailed assessment of all Phase I ESA findings. Geosyntec cannot "certify" or guarantee that any property is free of environmental impairment; no warranties regarding the environmental quality of the property are expressed or implied.

This Phase I ESA did not include the sampling of rock, groundwater, surface water, or other onsite substances or materials. Therefore, it is not possible to exhaustively identify every hazardous substance or petroleum product in the environments associated with the property.

The findings of this report, to the best of our knowledge, are valid as of the date of this work. However, changes in the conditions of a property can occur with the passage of time, whether due to natural processes or the works of man on this or adjacent properties. In addition, changes in applicable or appropriate regulations and standards may occur, whether they result from legislation, from the broadening of knowledge, or from other reasons. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside our control.

Specified information contained in this report has been obtained from publicly available sources and other secondary sources of information. Although care has been taken in reviewing the information when compiling it, Geosyntec disclaims any and all liability for any errors, omissions, or inaccuracies of the third parties in such information and data.

The work was performed using the degree of care and skill ordinarily exercised under similar circumstances by environmental consultants practicing in this or similar localities. No other warranty or guarantee, expressed or implied, is made as to the findings, opinions, conclusions, and recommendations included in this report.

1.6 User Reliance

This Phase I ESA report has been prepared solely for the benefit of Sheppard Mullin and Lennar. Geosyntec has issued the Phase I ESA report to its client and grants Sheppard Mullin and Lennar the right to rely on the report contents. Except as specifically set forth in the Agreement between Geosyntec, Sheppard Mullin and Lennar to perform this work, no third party except Sheppard Mullin and Lennar shall have the right to rely on Geosyntec's opinions rendered in connection with the services without Sheppard Mullin and Lennar's approval and Geosyntec's written consent, which may be conditioned on the third party's agreement to be bound to acceptable conditions and limitations.

2 USER PROVIDED INFORMATION

In accordance with ASTM E 1527-13, Geosyntec requested that the user of the Phase I ESA provide information that would assist in identifying the possibility of RECs in connection with the subject property, including but not limited to:

- Reviewing title and judicial records for environmental liens or activity and use limitations recorded against the subject property;
- Communicating specialized knowledge or experience that is material to RECs in connection with the subject property;
- Providing information about previous ownership or uses of the property;
- Providing information on a significantly lower purchase price, if applicable; and
- Designating personnel who are the most knowledgeable at the Site that will be interviewed by Geosyntec personnel.

Pertinent Site documents, including those provided by the user, are provided in Appendix B.

2.1 Title Records

The user provided Title Records for the Site, which are included in Appendix B.

2.2 Environmental Liens

The user is not aware of any environmental liens against the property.

2.3 Specialized Knowledge

The user provided knowledge regarding historical environmental investigations performed at the Site related to the Site's proximity to the adjacent landfill.

2.4 Commonly Known or Reasonably Ascertainable Information

The user did not provide commonly known or reasonably ascertainable information pertaining to RECs in connection with the property.

2.5 Valuation Reduction for Environmental Issues

The user indicated that the anticipated purchase price reasonably reflects the fair market value.

2.6 Owner, Property Manager, and Occupant Information

The user provided contact information for Mr. Sam Holty and Mr. Bill Hamlin, representatives for the current property owner, ACI Sunbow. A summary of Geosyntec's interview with Mr. Holty is provided in Section 4.2 of this report.

2.7 Reason for Performing Phase I ESA

Geosyntec understands that Sheppard Mullin and Lennar has requested this Phase I ESA to identify RECs associated with the property for consideration during potential acquisition of the Site for the purpose of developing the Site for residential purposes.

3 RECORDS REVIEW

3.1 General

The following sections present the results of the environmental database search and review of reasonably ascertainable historical aerial photographs, topographic maps, fire insurance maps, and historical city business directories.

3.2 <u>Database Search Report</u>

A database search report was obtained from Environmental Data Resources, Inc. (EDR) (Appendix C). The report documents findings of various federal, state, and local regulatory database searches regarding properties with known or suspected releases of hazardous materials or petroleum hydrocarbons. The searches were performed according to ASTM standards for Phase I ESA database searches. A list and description of the databases searched are included within the EDR report.

3.2.1 Site

The Site was not identified by EDR; however, several adjoining and nearby properties were identified by EDR and are discussed below.

3.2.2 Adjoining Properties

Two adjoining properties were identified in the databases searched by EDR. A summary of each listing is provided below:

- Hernandez Custom Paints at 599 Portsmouth Drive, approximately 164 feet west of the Site, is listed within the Resource Conservation and Recovery Act (RCRA) small-quantity generator (SQG) database for handling ignitable waste. No violations were noted for this facility, and based on the benign nature of the listing, it is unlikely this property has adversely affected the Site.
- Otay Sanitary Landfill (and related names) and Appropriate Technologies II at 1700
 Maxwell Road are listed under the following databases: Envirostor, California Solid Waste
 Facility/Landfill (SWF/LF), California Land Disposal Sites (LDS), California
 Enforcement (ENF), California Financial Assurance, California National Pollutant
 Discharge Elimination System (NPDES), California Integrated Water Quality System
 (CIWQS), and California Environmental Reporting System (CERS).

This property is directly south of the Site and consists of the closed Otay Class I Landfill adjacent to the active Otay Sanitary Annex Class landfill (Class III). The Class III landfill is owned by Republic Services and accepts nonhazardous wastes including construction and demolition wastes, green waste (compost), household trash, metals, and tires. The limited GeoTracker database listing within EDR for the Class III landfill indicates potential contaminants of concern including solvent or non-petroleum hydrocarbons, trichloroethene (TCE), nitrate, other inorganic [materials] / salt, lead, methyl tert-butyl

Geosyntec^o

concultante

ether (MTBE)/tert-butyl alcohol (TBA)/other fuel oxygenates, other petroleum, and total petroleum hydrocarbons (TPH). The landfill is currently operating under waste discharge requirements issued by the San Diego Regional Water Quality Control Board. The landfill received a notice of violation (NOV) for failure to submit information related to management of low-level radioactive wastes which were discovered at the Class III landfill; this information was to be submitted in response to an Executive Order implementing a moratorium on the disposal of low-level radioactive wastes at Class III landfills. The Class III landfill also received an investigative order and NOV requesting information related to excess leachate production and slope stability evaluation near an area of leachate ponding near the southeast corner of the landfill. The landfill has also received multiple stormwater-related violations of the NPDES permit, violation of water quality protection standards for a release of volatile organic compounds (VOCs) to groundwater, and other minor violations. Additional information for the Class III landfill was found on the State Water Resources Control Board GeoTracker database and is further discussed in Section 3.6.

The Otay Class I Landfill is listed within the California Waste Management Unit Database/Solid Waste Assessment Testing (WMUDS/SWAT) and Historical Cortese databases. This landfill accepted hazardous wastes per its classification as Class I; however, no additional information was discernible within the EDR report as the listing was commingled with the Omar Rendering Company facility. However, additional information reviewed on GeoTracker is discussed in Section 3.6.

Appropriate Technologies is also listed at 1700 Maxwell Road, and is listed as a hazardous waste facility that accepted hazardous and non-hazardous liquid sludge and slurry wastes in bulk, hazardous liquid/solid waste in drums or other approved containers, as well as polychlorinated biphenyls (PCBs) and explosive and radioactive materials. The listing indicates this facility is surrounded by the Otay Class I Landfill and is zoned for open space and park development. No disposal is reported onsite, and all storage is reported to have been temporary. Based on the EDR listing, it appears that a washout pit and unlined effluent pipes also existed at or near this facility, which were closed under the Department of Toxic Substances Control (DTSC) in 1995 after a remedial feasibility investigation (RFI) concluded that there is no further investigation necessary for the washout pit and pipes, and the facility was closed under the DTSC in 1996. Based on the "No Further Action" (NFA) designation granted by the DTSC, the facility's former location hydraulically downgradient to the Site, and its use as a storage facility with no disposal reported, this location is unlikely to have adversely impacted the Site.

BKK Corporation, including listings for Ecology Auto Parts, is also listed at 1700 Maxwell Road. BKK is listed as having had three underground storage tanks (USTs) for waste storage. Review of the permits shows two "USTs" were waste storage lagoons constructed with 6 inch concrete and one 13,500-gallon sump. Materials placed in the sump were not specified. Storage, bulking, and/or transfer off-site and chemical use are

consultants

also listed in EDR and it appears BKK treated waste being disposed of at the Class I landfill. Additional information related to the BKK Corporation presence at the landfill was found during online database search and is discussed in Section 3.6.

Within the BKK listing is Ecology Auto Parts; this facility was actually located at 850 and 825 Energy Way, approximately 0.5 miles south of the Site and south of the landfill facility. Ecology Auto Parts is listed as a hazardous waste generator with various minor housekeeping- and training-related violations. Additional information for Ecology Auto Parts was found on GeoTracker and is discussed in Section 3.6.

3.2.3 Properties within ½-Mile of the Site

Several nearby properties within one half-mile of the Site were listed under one or more databases; notable listings are below.

• A&W smelter and refinery (A&W) on Silver Queen Road is reportedly located approximately 0.4 miles southeast of the Site and is listed within the EDR Potentially Responsible Party (PRP), Superfund Enterprise Management System (SEMS), lead smelters, and California HAZNET databases. The actual refinery is not located near the Site; however, A & W attempted to send seven truckloads across the Mexico border to dispose of unusable ore containing lead and considered hazardous waste (U.S. District Court, 1997). These trucks were detained and temporarily impounded at the Appropriate Technologies II facility by U.S. Customs. A & W did not secure transportation in a timely manner, and the unusable ore was transported to a federally-approved treatment, storage, and disposal facility. Soil discussed in this listing was not present at the Site and therefore is not likely to have adversely affected the Site.

3.2.4 Properties within One Mile of the Site

Four properties within one mile of the Site were identified in several database searched by EDR. These properties are listed below.

- 1886 Auto Park Place, approximately 0.7 miles southeast of the Site is listed as Omar Rendering Facility, and was identified under the historical Cortese, Deed, Land Disposal Site, Cortese, Enforcement, and other databases related to handling or storage of hazardous materials. This facility reportedly utilized evaporation ponds to treat hazardous wastes from 1959 to 1978. The ponds containing evaporated materials were excavated and disposed of offsite, and soil from beneath the pond footprints was disposed of in a lined cell on the Site. Groundwater monitoring and cell cap maintenance are ongoing. Additional information was found on GeoTracker and is discussed in Section 3.6.
- 4501 Otay Valley Road, approximately 0.8 miles southwest of the Site, is listed under Nakano Farms and within the EnviroStor, Cleanup Program Sites – Spills, Leaks, Investigations, and Cleanups (CPS-SLIC), Statewide Environmental Evaluation and Planning System (SWEEPS), Historical UST, and HMMD databases. One UST is reported

concultante

at this property, and the cleanup is reported to have been completed and closed as of May 1996; additional information was not provided in the Radius report and was not found on GeoTracker or EnviroStor; however, based on the distance of this facility from the Site and orientation hydraulically downgradient from the Site, it is not likely this facility adversely impacted the Site.

- 4551 Otay Valley Road, approximately 0.8 miles south of the Site and listed under the
 EnviroStor and Bond Expenditure Plan databases under Apache Services. This property
 was used as a salvage yard that may have received materials from nearby naval facilities.
 The property is impacted with metals, petroleum products, and solvents and is located on
 fill material. No further information was provided; however, based on distance from the
 Site and nature of surficial impacts, it is not likely this property has adversely impacted
 the Site.
- Proposed Otay Ranch School on Camino Prado is listed under the Envirostor and School
 databases. The potential school site is being investigated for potential methane mitigation
 and is being evaluated for suitability for school use under the Department of Toxic
 Substance Control (DTSC). Based on the nature of the listing, it is not likely this property
 has adversely affected the Site.

No orphan sites were identified in the EDR Radius Report.

3.3 <u>Historical Aerial Photographs and Topographic Maps</u>

Historical aerial photographs (aerials) from 1949, 1953, 1964, 1966, 1970, 1979, 1985, 1989, 1994, 2005, 2009, 2012, and 2016, and USGS topographic maps (topos) for years 1904, 1930, 1943/1944, 1953, 1955, 1975, 1991, 1994/1996, and 2012 were received from EDR; aerials for 1953, 1964, 1966, 1968, 1971, 1981, 1989, 1994, 1996, 2002, 2003, 2005, 2009, 2010, 2012, 2014, and 2016 and topos for years 1908, 1911, 1915, 1920, 1920, 1928, 1932, 1941, 1943, 1955, 1957, 1958, 1960, , 1961, 1962, 1963, 1973, 1977, 1982, 2002, 2012, 2015, and 2018 online at HistoricAerials.com; and aerials dated 1994, 1996, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, and 2018 on GoogleEarthPro [HistoricAerials.com, 2020; GoogleEarthPro, 2020]. A summary of historical Site use based on review of the aerials and topos is provided below:

- The oldest available topos indicate the Poggi Canyon Creek flowed through the northern portion of the Site. The Otay River is shown south of the Site, south of a road with several small structures. Telegraph Canyon and several additional roads are shown to the north of the Site.
- A 1949 aerial indicates a pit mine with benched side walls visible south of the Site, as well as a property that may have been agricultural located south of the pit mine. An unpaved access road traverse through this property to the pit mine. The surrounding area appears to be largely undeveloped native land.

consultants

- A 1953 topo depicted a "borrow pit" in the area south of the Site, alluding to mining of bentonite that occurred in this area prior to landfill use. The 1953 aerial confirmed the presence of the borrow pit and the agricultural property south of the borrow pit appeared to be a dairy or cattle feed lot. By 1964, it appears the borrow pit was converted to its landfill use and surrounding operations, including the rendering landfill and other industrial facilities located further south. It appears borrowing or surveying for an expansion of the Class I landfill took place around this time, based on a cleared grid around the existing boundaries of the landfill, and what appears to be a sludge or liquid treatment area with six beds is visible within the landfill footprint. By 1966, the water tower on the top of the hill south of the Site had been constructed. The remained undeveloped.
- The 1970 aerial indicated the landfill had been expanded to the south, and a second water tower had been constructed southwest of the Site. Grading activities are visible in the aerial to the north and appear to be pre-construction or agriculture. The Site remained undeveloped.
- The 1975 topo the areas west, northwest, and southwest of the Site had been developed with residential subdivisions and schools. The 1979 aerial showed subdivisions constructed adjoining the Site to the southwest and west, and construction of the existing medical facility and ancillary structures has begun approximately 0.5 miles north of the Site. The landfill operations in the areas south of the Site, likely indicating the Class III landfill had begun operating. It appears soil was borrowed from the eastern portion of the Site around this time, for landfill use or some other purpose. By 1985, landfill operations had expanded to the east. The Site remained undeveloped.
- The 1991 topo depicted the landfill area to the south as a "Gravel Pit" on the topo, but the aerial appears to indicate the area south of the Site was primarily used for landfilling. By 1994, the extent of the Class III landfill appeared similar to its current footprint.
- By 2005 Olympic Parkway had been constructed north of the Site, and the area north of Olympic Parkway had been developed with residences. The Site remained vacant and undeveloped, with access points to the Site from Olympic Parkway. By 2006, a third larger water tower had been constructed south of the Site. Landfill operations at the Class III landfill appeared similar.
- The 2018 aerial indicated the Site remained undeveloped, and landfill activities continued
 on the adjoining property southeast of the Site. The adjoining areas southeast and east of
 the landfills had either been developed with residences or were undergoing residential
 development.

3.4 Sanborn Maps

EDR conducted a search for Sanborn fire insurance maps for the Site area. EDR reported map coverage was not available for the area (Appendix F).

3.5 <u>City Directories</u>

City directories were searched by EDR for available years from 1971 to 2014 to assess occupancy at the Site and adjoining properties (Appendix G). The Site was not listed in the City Directory. Properties within the vicinity of the Site along Olympic Parkway, Brandywine Avenue, East Palomar Street, and Maxwell Road included listings from 1965 to 2014 for various residential, commercial, and light industrial properties. In 1987, 1700 Maxwell Road is listed under BKK Corporation. By 1992, this address was listed under Greenfield Environmental Inc., 1600 Maxwell was listed under Pacific Energy, and 1800 Maxwell was listed under San Diego Gas & Electric Co. In 2000, 1700 Maxwell was listed as Otay Landfill, with 1751 Maxwell listed as Otay Landfill Buy Back Center. By 2005, 1600 Maxwell was listed as Covanta Power Pacific Inc., 1700 Maxwell listed as Solutient Technologies (a radiological service, environmental consulting, and remediation services business), and 1800 Maxwell is listed as City of Chula Vista Corp. Yard Project and National Express Corporation; 1855 is listed as J&G and Vidrio Towing. By 2010, 1700 Maxwell was listed as Republic Services (current owner). 1700 Maxwell continued to be listed under Otay Landfill Inc., and Republic Services Inc., and 1600 Maxwell included Otay Landfill Gas LLC by 2014. The listing at 1700 Maxwell is directly related to the Otay Class I and III landfills. It appears the 2005 listing at the Otay Landfill address for Solutiont Solutions may be related to testing for radiological wastes at the landfill; 2005 was also the year the moratorium on low-level radioactive waste to Class III landfills was enacted. Based on city directory listings obtained, no evidence of additional RECs was identified.

3.6 Local Regulatory Agencies

Geosyntec contacted the following federal, state, and local agencies and accessed associated online databases to identify information pertaining to the Site. Pertinent documents obtained from the agencies are provided in Appendix B:

- California Department of Oil, Gas, and Geothermal Resources (DOGGR) Database
- Cal Fire Office of the State Fire Marshal
- Chula Vista Building Department
- Chula Vista Public Works Department Industrial Waste
- City of Chula Vista Fire Department
- Department of Toxic Substances Control (DTSC) Cypress, Chatsworth, and San Diego Offices, and EnviroStor Database
- Regional Water Quality Control Board (RWQCB) San Diego Region, and GeoTracker Database
- San Diego Air Pollution Control District
- San Diego County Hazardous Materials Management Division
- United States Environmental Protection Agency (USEPA) and MyPropertyInfo Database

consultants

Pertinent records received to date and/or obtained from publicly available online sources are summarized below. If files are received after finalization of this report which change the conclusions herein, an addendum will be prepared.

DTSC and EnviroStor Database

On 26 December 2019, representatives from the DTSC Cypress, Chatsworth, and San Diego offices indicated that their department had no records for the Site. No pertinent cases related to the Site were identified in the DTSC EnviroStor database. However, one document regarding the Appropriate Technologies II facility was found in the EnviroStor database. This document from the DTSC acknowledged a report documenting that closure of the Appropriate Technology facility had been performed in accordance with the approved closure plan, and indicated closure was officially approved as of 29 October 1998 for this facility. Further online research indicates the Appropriate Technologies facility was owned by BKK Corporation, and was used for treatment of liquid waste (Winters, 1983). This facility used a single-module system with a tank farm and chemical mixing plant to treat liquid wastes prior to disposal at the landfill, effectively categorizing this as a treatment, storage, and disposal (TSD) facility. However, records show disposal did not occur at this facility. Based on the closure of the facility and ongoing monitoring of the surrounding Class I landfill, it is unlikely this facility has adversely impacted the Site.

City of Chula Vista Fire Department

On 27 December 2019 a representative from the City of Chula Vista Fire Department indicated that the fire department had no records for the site.

Cal Fire – Office of Fire Marshall

On 31 October 2018 a representative from Cal Fire indicated that they had records related to the Site. This included records for two listings on Olympic Parkway: one listing at 1250 Olympic Parkway for a gas leak at the Otay Ranch High School approximately 1.5 miles northeast of the Site, and one listing for a gasoline-related incident in the street in February 2018 at the intersection of Brandywine Avenue and Olympic Parkway, adjacent to the Site to the west. No additional information was provided; however, it does not appear these incidents occurred at or adversely impacted the Site.

Chula Vista Public Works Department – Industrial Waste

The Chula Vista Public Works Department for Industrial Waste indicated their representatives have extended their response deadline to 16 January 2020; as of this date, no records have been returned from this department. However, the City Clerk's office did provide a record of an inspection regarding a water tower. As described in Section 3.3, the water towers are located on adjoining properties south of the Site. This record is included in Appendix B.

Chula Vista Building Department

On 23 December 2019 a representative from the Chula Vista Building Department indicated that there were no records pertaining to building permits or certificates of occupancy for the Site.

San Diego Air Pollution Control District

On 30 December 2019 a representative from the San Diego Air Pollution Control District indicated their agency had no records for the Site.

United States Environmental Protection Agency (USEPA) and MyPropertyInfo Database

As of 24 January 2020, the USEPA had not completed the request for records for the Site. Additionally, no records for the Site were identified in the USEPA's MyPropertyInfo database.

Regional Water Quality Control Board (RWQCB) and GeoTracker Database

Cases related to nearby properties were identified in the RWQCB's online GeoTracker database. A summary of pertinent findings is below:

The closed Otay Class I Landfill is adjacent to the Site to the south. This landfill accepted hazardous waste from 1963 to 1980 (RWQCB, 2000). This landfill does not have a liner and therefore has no leachate collection system. A groundwater monitoring network exists at the landfill and is monitored on a semiannual basis. The most recent semiannual groundwater monitoring report, dated October 2019, indicates that several groundwater monitoring wells screened in the perched zone aquifer contained concentrations of VOCs, some over their respective Maximum Contaminant Levels (MCLs) and applicable Water Quality Protection Standards (WQPS) (Geosyntec, 2019). However, the wells containing detectable concentrations of VOCs are situated in the southern portion of the landfill and not near the boundary of the Site. One well screened in the intermediate aquifer also contained detectable concentrations of VOCs; however, this well is also in the southern portion of the landfill, and the VOC detections have been attributed to landfill gas from the adjoining Class III landfill. The VOCs in the perched aquifer may also be attributable to the adjoining Class III landfill, as this landfill does not have a perched zone monitoring network and samples collected from the extraction wells screened in the perched zone at the Class III landfill contained VOCs in excess of WOPS and MCLs. Leachate levels at the Class III landfill have also reportedly risen significantly in the last two years, resulting in a NOV to the landfill and subsequent corrective action; constituents detected in the Class I landfill monitoring network are indicative of migration of constituents from saturated waste, leachate, or condensate impacts from the Class III landfill. The Otay Class I landfill does not have a methane monitoring system. Based on the results of groundwater monitoring at the facility, no VOCs detected in the monitoring wells closest to the Site at this facility, and groundwater flow away from the Site within this facility, it is not likely that this facility has adversely impacted the Site. Methane monitoring is discussed below (Class III landfill).

Geosyntec consultants

- The Otay Annex Sanitary Landfill (Class III landfill) is located adjacent to the Class I landfill and adjoining the Site to the southwest. The Class III landfill detached from the Class I unit in 1997 and is now operated by San Diego Landfill Systems. The most recent semiannual groundwater monitoring report, dated October 2019, indicated that VOCs were detected in monitoring wells in the southern portion of the Site, and no VOCs were detected in the monitoring wells closest to the Site, which are screened in the intermediate aquifer. VOCs were detected in wells downgradient of a subsurface slurry wall and the extraction wells that remove groundwater and pump it to a tank used for dust control as part of the corrective action program (CAP). These wells are screened in the perched zone and frequently contain VOCs above detectable and allowable limits. Groundwater flow depicted in the October report indicates that groundwater in the Class III landfill is to the west in the eastern portion of the landfill and to the northwest in the western portion of the landfill, both toward the Site. The lack of detections of VOCs in the downgradient wells closest to the Site indicate impacts have not migrated onto the Site within the intermediate aquifer, and detections at the Class I landfill in the perched zone in the southeastern corner of the Class I landfill indicate VOCs are most likely confined to the southern portions of each landfill. In addition to the groundwater monitoring network and CAP, a landfill gas control system (LFGCS) also operates at the Class III landfill, and the landfill is monitored by a network of perimeter probes. In the Quarterly Monitoring Report dated 29 April 2019, two perimeter probes were reported to have contained methane above the lower explosive limit (LEL) of 5% by volume during 2018 and one above the LEL in March 2019; an NOV was issued and remedial actions in cooperation with the LFG system are ongoing. The probes containing methane above the LEL are on the eastern and southeastern boundary of the landfill. The perimeter probes (all intervals) closest to the Site did not contain methane during field screening during the first quarter 2019. Review of several additional methane monitoring reports indicate methane has not been detected in the perimeter probes closest to the Site, indicating the LFGCS is effectively controlling landfill gas migration from the landfill.
- The former Omar Rendering Facility is located approximately 0.7 miles southwest of the Site. As noted in Section 3.2.4, this facility housed six Class I waste ponds, the contents of which were removed in 1980. The impacted soils beneath the pond were excavated and placed in a lined cell in the northwest corner of the Site, which is currently capped and used as a parking lot accessed from Auto Park Place. Review of the most recent annual report for this facility indicates groundwater has been impacted with VOCs (primarily TCE and PCE), semi-volatile organic compounds (SVOCs), and inorganic constituents (APTIM, 2019). A flow map in the most recent groundwater monitoring report shows groundwater flow to the south, away from the Site. Groundwater mounding appears to have occurred at this facility during operations of the ponds, which may have pushed constituents against the gradient to the north; however, these beds have been decommissioned since 1980 and

Geosyntec D

concultante

the flow map in the most recent report indicates groundwater flow is to the south. One Leaking Underground Storage Tank (LUST) is also reported at this facility; however, the impacted soil was excavated, and the release received closure from the DEH in 1993 with residual contamination below method detection limits (MDLs). Based on the LUST NFA, this facility's distance from the Site and its orientation hydraulically downgradient from the Site, it is unlikely this facility has adversely impacted the Site.

• Ecology Auto Parts was confirmed at 825 Energy Way, approximately 0.5 miles south of the Site. Two closed LUST sites are mapped at this location; one LUST received NFA from the RWQCB in July 2019 and no information is provided about the second LUST with the exception of a monitoring report from 2006; it appears these were part of the same investigation. Based on the closure of the cases at this facility, its distance from the Site, and orientation hydraulically downgradient to the Site, it is not likely this facility has adversely impacted the Site.

On 6 January 2020 a representative from the Regional Water Quality Control Board (RWQCB) indicated that their department had no records for the site.

San Diego County Hazardous Materials Management Division (Dept. of Environmental Health)

On 26 December 2019, a representative from the DEH indicated HMMD had no records for the site. A query for the Site parcel numbers on the DEH Document Search Website returned monitoring well technical reports for a site unrelated to the Subject Property and no documents related to the Site.

California Department of Oil, Gas, and Geothermal Resources (DOGGR) Database

Review of the DOGGR database on 15 January 2020 indicated that no oil or gas wells are located on the Site. The nearest oil and gas wells are over a mile from the Site to the east, west, and south.

3.7 Previous Site Assessment Reports

One previous Phase I environmental site assessment report was provided by the User. This report was prepared by ENVIRON International Corporation for the City of Chula Vista in 2005 for the purpose of evaluating two portions of land (including the Site) in connection with the proposed zoning change and development of the subject property as a residential community. The site assessment was conducted concurrently with a Human Health Risk Assessment (HHRA) that evaluated potential human health risks associated with the adjacent landfills and associated operations. No RECs were identified as part of this Phase I ESA. *De minimis* conditions included the Site's proximity to the adjacent landfills, which are sources of landfill gas, particularly methane, which can migrate through waste and soil and cause an explosive hazard, as well as chemical and human health concerns; this condition was evaluated in the HHRA (discussed below). Additionally, the proximity to the Class I landfill indicated VOCs and other waste constituents may be present in groundwater near the Site; however, the site assessment indicated that VOCs are not likely to migrate to the Site based on trends assessed at the time. This report

Geosyntec^D

consultants

also addressed the proximity of the Appropriate Technologies II facility to the Site; however, the report did not deem the Appropriate Technologies II facility a REC due to NFA granted in 1996, generally good housekeeping notes, and no disposal reported at the facility.

As noted above, an HHRA and Nuisance Analysis was conducted by ENVIRON concurrently with the Phase I ESA to evaluate human health risk, nuisance, and odor impacts to the Site from the adjacent facilities (ENVIRON, 2005). Emissions were identified as those from combustion engines and a flare that burns landfill gas, fugitive gas emissions from the landfill surface, and emissions from various landfill activities. The HHRA concluded that the cancer risks and chronic and acute hazard indices for the potentially maximally-exposed individual at both parcels evaluated (same areas of land discussed in the Phase I report) were less than the significant thresholds established by the Office of Environmental Health Hazard Assessment (OEHHA). The report also concluded that approximately 5% of the Site would experience dust deposition rates greater than the deposition guideline of 67 grams per square meter per year $(g/m^2 - yr)$ which may generate complaints from residents. The odor analysis portion of the HHRA yielded results indicating odors may exceed published odor thresholds at the Site (based on the results of surrogate chemicals hydrogen sulfide and acetaldehyde used in modeling; hydrogen sulfide was found to be produced at concentrations higher than the geometric mean of the odor threshold for one or more receptors at the Site for a portion of the time over a one-year period. Acetaldehyde impacts did not exceed this threshold). The HHRA also concluded that landfill gas was not likely migrating onto the Site based on review of perimeter probe monitoring data, although the potential exists as long as the landfill is generating LFT. ENVIRON recommended a soil gas survey be performed on the parcels to confirm that no LFG was migrating past the probes. It does not appear that a soil gas survey was performed after 2005 to evaluate methane concentrations.

Limited Soil-Gas, Soil, and Groundwater Sampling Report was prepared by Geocon Environmental Consultants in 1994 for the purpose of evaluating potential presence of hazardous materials within the soil pore gas, soil, and groundwater at the subject property (in this case, the southeastern portion of the Site). Three vadose moisture monitoring wells and seven gas probes with three screened intervals each were already existing at the Site at the time of this investigation, and two temporary groundwater monitoring wells were installed/advanced at the Site in the southeastern portion of the Site. During the investigation in 1994, vadose moisture wells were gauged for moisture twice, the gas probes were refurbished and screened twice (one probe sampled once), samples were collected from the groundwater monitoring wells, and soil samples were collected from the exploratory borings. No liquid was detected in the vadose zone wells during either monitoring event. Methane was detected at 1% LEL in G1-G (shallow interval) along the southeastern boundary of the Site, and at 13% LEL in G6-G (shallow interval) along the eastern boundary of the Site during the April screening. Methane was again detected at 1% LEL in G1-G and at 8% LEL in G6-G, 4% LEL in G6-R (middle interval), and 8% LEL in G6-B (lower interval) during the May screening event. A sample was collected from G6-G during one of the monitoring events, yielding a methane concentration of 3,300 ppm. The LEL for methane is 50,000 ppm (5% by volume), which was not exceeded; however, these results indicate landfill gas migration onto

Geosyntec >

consultants

the Site, likely from the adjoining Class III landfill. Groundwater samples collected in the southeastern portion of the Site did not contain detectable VOCs or SVOCs, but selenium, chromium, and arsenic also exceeded MCLs in one well. Analysis of one soil sample collected from one of the exploratory borings indicated that halogenated VOCs were not detected in soil above the MDL.

A limited soil vapor investigation was performed by Geosyntec in January 2020 in support of Lennar's pre-purchase due diligence process, and was conducted to address potential environmental concerns related to the operating Republic Services Otay Mesa Class III Landfill located adjoining south and southeast of the site (Figure 3). The soil vapor investigation conducted on 24 and 27 January 2020 documented methane was not detected in the samples, indicating that the LFGCS is effectively controlling the migration of methane from the adjoining Class III landfill (Geosyntec, 2020). Low-level concentrations of VOCs were detected in soil vapor samples collected at the site, including four analytes detected in one or more samples at concentrations at concentrations above San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Tier 1 Environmental Screening Levels for Residential Sub-slab / Soil Gas (Tier 1 ESLs) [SFBRWOCB, 2019]. These screening levels are based on an excess lifetime cancer risk (ELCR) of "one-in-a-million" (denoted as 1x10⁻⁶) as an acceptable risk level, and were derived based on a generic conservative conceptual site model designed for use at most sites for site screening purposes. However, these screening levels do not account for additional attenuation with depth into the soil column, quality of the overlying concrete slab, or other site-specific factors, and are therefore overly conservative for use at the site. Instead, comparison to default DTSC screening levels (SLs) for future residential structures is more appropriate. Default DTSC-SLs for preliminary screening evaluations differentiate between samples collected from the interval immediately below the slab and samples collected from SVPs screened within the vadose zone, because VOCs in soil vapor at depth are additionally inhibited from upward migration due to inherent properties of the overlying soils (such as permeability and moisture content). Further, the DTSC-SLs for future residential structures more appropriately account for additional attenuation resulting from the use of modern construction methods, earthwork/grading activities, and new, competent concrete slab pours. Using the DTSC-recommended default attenuation factors, no analytes were detected in excess of the calculated DTSC-SLs for subsurface soil vapor beneath future residential structures. Therefore, with the understanding that the adjoining Class III landfill owner/operator will continue to operate the LFGCS in accordance with Title 27 requirements, future earth-moving activities in preparation for site development and construction will likely result in dissipation of residual VOC concentrations in shallow soil vapor, and future structures will be constructed using modern building practices with competent concrete slabs, there is no apparent unacceptable risk to future residential site occupants due to methane and/or VOCimpacted soil vapor. A copy of the January 2020 Soil Vapor Investigation Summary is included in Appendix B.

4 INTERVIEWS

The user provided contact information for Mr. Sam Holty, Vice President of Ayers, the property management group for the Site owner, ACI Sunbow. A summary of the interview conducted is presented below:

4.1 <u>Interview of Site Contact</u>

On 10 January 2020, Geosyntec conducted an interview with Mr. Sam Holty, a representative for the property management group (Ayers) for the Site owner. During the interview, questions were asked regarding Site use and conditions, typical of a Phase I ESA interview in accordance with ASTM E 1527-13. Mr. Holty indicated that he has been associated with the Site since 1996 when ownership began. Key elements of the interview are as follows:

- When asked about property history, Mr. Holty indicated he did not have knowledge of any previous tenants or their use of the Site, if any.
- When asked about the current use of the Site, Mr. Holty indicated that the Site is currently vacant and undeveloped.
- When asked about wells or tanks at the Site, Mr. Holty indicated he was not aware of any monitoring wells at the Site.
- When asked about possible historical placement of fill soil or waste disposal onsite, Mr. Holty was not aware of fill soil or waste disposal performed onsite. He indicated some soil may have been borrowed from the Site during Olympic Parkway construction.
- When asked about drains on the property, Mr. Holty indicated that no buildings are on the Site and a wetland is present in the northern portion of the Site. This wetland discharges off the property to the west through a culvert and passes beneath several culverts on the Site.
- When asked about knowledge of hazardous substances or petroleum products at the Site, Mr. Holty was not aware of any such use or storage at the Site.
- Mr. Holty reported that he had no knowledge of any spills, leaks, or environmental incidents associated with the property.
- Mr. Holty indicated that the wetlands on the Site are permitted under a 404 Permit (Clean Water Act [CWA] section 404 permit for regulating the discharge of fill/dredged material to waters of the United States and wetlands). Mr. Holty also indicated there is an easement through the Site for the reclaimed water utility line. Mr. Holty indicated descriptions of both areas are included in the Title Report for the Site.
- Mr. Holty indicated there are no land use restrictions for the Site for contamination purposes; however, he indicated only approximately 54 acres in the southeastern portion

Geosyntec D

consultants

of the property were allowed to be developed, as the remainder are part of the Habitat Conservation/Multiple Species Conservation plan.

4.2 <u>Interview of State and/or Local Officials</u>

No case managers were identified at regulatory agencies which may have had files related to the Site; therefore, interview of regulatory personnel was not performed.

5 SUMMARY OF SITE RECONNAISSANCE

5.1 <u>Methodology</u>

The following section summarizes observations made during the Site reconnaissance performed by Ms. Rose Propst of Geosyntec on 3 January 2020. The Site reconnaissance included a walking survey of the Site. The adjoining properties were inspected from public right-of-way and where visible from the Site. The Site layout and features as identified during the Site reconnaissance are depicted on Figure 2. Photographs taken during the Site reconnaissance are included in Appendix H.

Reconnaissance Observations

A summary of the reconnaissance observations is provided in Table 1. Notable observations are summarized below:

- The Site is accessed from Olympic Parkway from three areas that cross over culverts perpendicular to surface water flow in the northern portion of the Site. These areas are gated off from vehicle access. The surface water flows from east to west along the northern boundary of the Site. From this area, the Site slopes steeply up to the south.
- The Site is undeveloped, with tall grass and scrub across the majority of the Site. Several dirt paths traverse the Site. The Site is fenced along part of the eastern perimeter and along the entire southern perimeter. The property to the southeast and south is occupied by the closed Otay Class I landfill and the active Otay Class III landfill.
- Odors believed to originate from the active Class III landfill were noted at the Site. A mattress was observed near the easement near Olympic Parkway, and a couch was observed at the top of the hill. Several small pieces of debris appeared to have blown in from the wind.
- One transformer was observed in or directly adjoining the northeastern corner of the Site along the roadway easement (ID J8269-03). No PCB stickers were observed. A reclaimed water line was marked along the easement and crossing into the Site.
- Monitoring vaults and flush-mounted features were observed along the property lines in the southeastern portion of the Site, including one near the point of access along Olympic Parkway, and one outside the fence line along the southern boundary with "CP Test" markers that may be related to a recycled water pipeline which traverses the Site. Monuments observed along the southern and eastern boundary of the landfill and appeared to be monitoring wells or soil gas probes (confirmed by documentation from the User). The monuments were locked or rusted shut and not able to be accessed at the time of the reconnaissance.
- Perimeter gas probes were observed outside the southern and eastern fence line near the landfill boundary. A large warehouse-style building was also observed directly south of the southeast corner of the Site.

6 SUMMARY OF FINDINGS

Geosyntec has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-13 for an approximately 136-acre property located at on Olympic Parkway in Chula Vista, California (the Site; Figures 1 and 2). This assessment has revealed the following:

6.1 <u>Site Conditions and Use</u>

The Site is situated on a hillside and slopes steeply from the south down to a permitted wetland along the northern boundary of the Site, parallel to Olympic Parkway. This wetland drains through a series of culverts and discharges from the northwest corner of the Site. Several panels of concrete are near the culverts and appear to assist with surface water drainage. There are no buildings on the Site, and several footpaths traverse the Site. Seven gas probes, three vadose monitoring wells, and two monitoring wells currently exist on the Site (Figure 2). Monuments and vaults labeled "CP Test" and believed to be associated with a recycled water pipeline which traverses the Site were also observed. The Site is bounded by chain-link fencing along the southern perimeter, which partially extends along the eastern border. Several chain-link gates are located at vehicle access locations from Olympic Parkway on the north side of the Site.

The Site has been historically vacant and undeveloped, and remains vacant and undeveloped.

6.2 Offsite Conditions and Use

Properties in the Site vicinity have historically been used for bentonite (clay) mining, landfilling, and other industrial, commercial, and residential purposes. The Site is bounded to the north by Olympic Parkway; directly north of this is an undeveloped hillside, followed by residential subdivisions. Portions of the Otay Annex Sanitary Landfill adjoin the property to the southeast, and the property directly east of the Site is vacant and undeveloped. The Otay Annex Sanitary Landfill, also known as the Otay Class III landfill, extends west and also adjoins the Site to the south and surrounds the adjoining Otay Class I Landfill. Residential developments are situated southwest and directly west of the Site, and east and south of the Otay Class III landfill. Both the Class I and Class III landfills have groundwater monitoring networks which are monitored semiannually under orders issued by the San Diego Regional Water Quality Control Board. Groundwater at both landfills is generally to the south-southwest away from the Site, and there are no indications of groundwater impacts beneath the site attributable to the two adjoining landfills. The Class III landfill is equipped with a landfill gas control system (LFGCS) and a perimeter probe monitoring network which is routinely monitored under the direction of the County of San Diego Local Enforcement Agency. Methane has not been detected above 1% by volume at the perimeter probes closest to the Site.

6.3 <u>Data Gaps</u>

In accordance with ASTM E1527-13, this section documents data gaps in the information obtained and reviewed as part of this Phase I ESA and discusses the associated significance. A data gap is

consultants

defined in ASTM E1527-13 as being "... a lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information." Following investigation, it appears that "data gaps" as defined by ASTM, exists for file review requests which have not been received from some regulatory agencies. Based upon the available information, although these data gaps exist, it is believed that they have not affected the identification of recognized environmental conditions at the Site.

6.4 Recognized Environmental Conditions

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-13 of the Site which encompasses approximately 136-acres located on Olympic Parkway in Chula Vista, California. Any exceptions to, or deletions from, this practice are described in Section <u>6.3 Data Gaps</u> of this report. This assessment has revealed no evidence of recognized environmental conditions in connection with the property, except for the following:

• Historical investigations performed in the 1990s to assess potential impacts to the Site from the adjoining landfill properties identified subsurface methane which had migrated beneath the Site from the Class III landfill at concentrations up to 3,300 parts per million (ppm) methane, which is more than an order of magnitude lower than the lower explosive limit (LEL) of methane (50,000 ppm, or 5% by volume). To address the absence of recent soil vapor data for the site, a limited soil vapor investigation was conducted at the Site in January 2020 to evaluate current onsite subsurface soil vapor conditions and potential subsurface impacts attributable to the adjoining Otay Class III landfill. The soil vapor investigation documented methane was not detected in the samples, indicating that the LFGCS is effectively controlling the migration of methane from the adjoining Class III landfill. Low-level concentrations of VOCs were detected in soil vapor samples collected at the site, including four analytes detected in one or more samples at concentrations at concentrations above their respective Tier 1 ESLs or EPA RSLs for a residential site scenario. However, none of these analyte concentrations exceeded calculated DTSC-SLs for future residential construction. Therefore, with the understanding that the adjoining Class III landfill owner/operator will continue to operate the LFGCS in accordance with Title 27 requirements, future earth-moving activities in preparation for site development and construction will likely result in dissipation of residual VOC concentrations in shallow soil vapor, and future structures will be constructed using modern building practices with competent concrete slabs, there is no apparent unacceptable risk to future residential site occupants due to methane and/or VOC-impacted soil vapor.

6.5 **De Minimis Conditions**

De minimis conditions are environmental conditions which generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of the appropriate governmental agencies. Conditions determined

Geosyntec consultants

to be de minimis are not RECs. De minimis conditions identified at the Site include debris and several pieces of discarded furniture, including a couch and a mattress, observed at the Site.

7 CERTIFICATION

This environmental site assessment (ESA) was prepared in accordance with the scope of work, terms and conditions described in Geosyntec's proposal dated 20 December 2019. This proposal incorporated by reference the ASTM Standard E 1527-13, *Standard Practice for Environmental Assessments: Phase I Environmental Site Assessment Process*.

"I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in §312.10 of 40CFR 312 and I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312."

TABLE 1

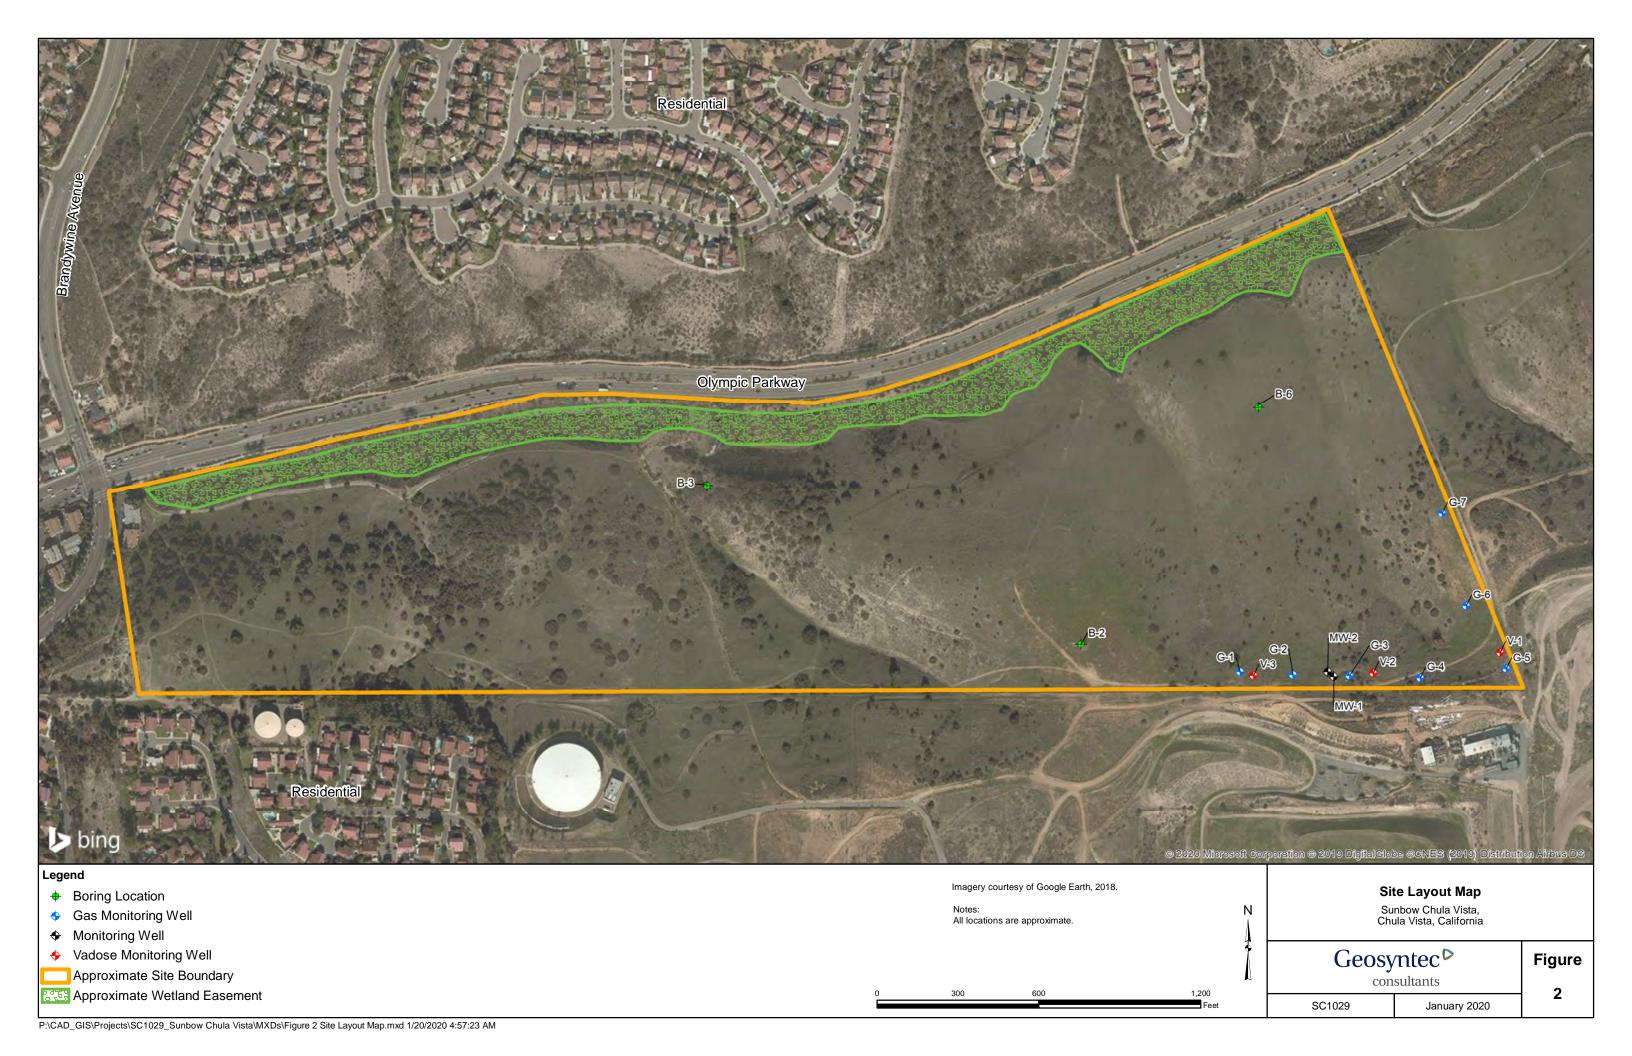

Summary of Site Reconnaissance Phase I ESA Chula Vista, California

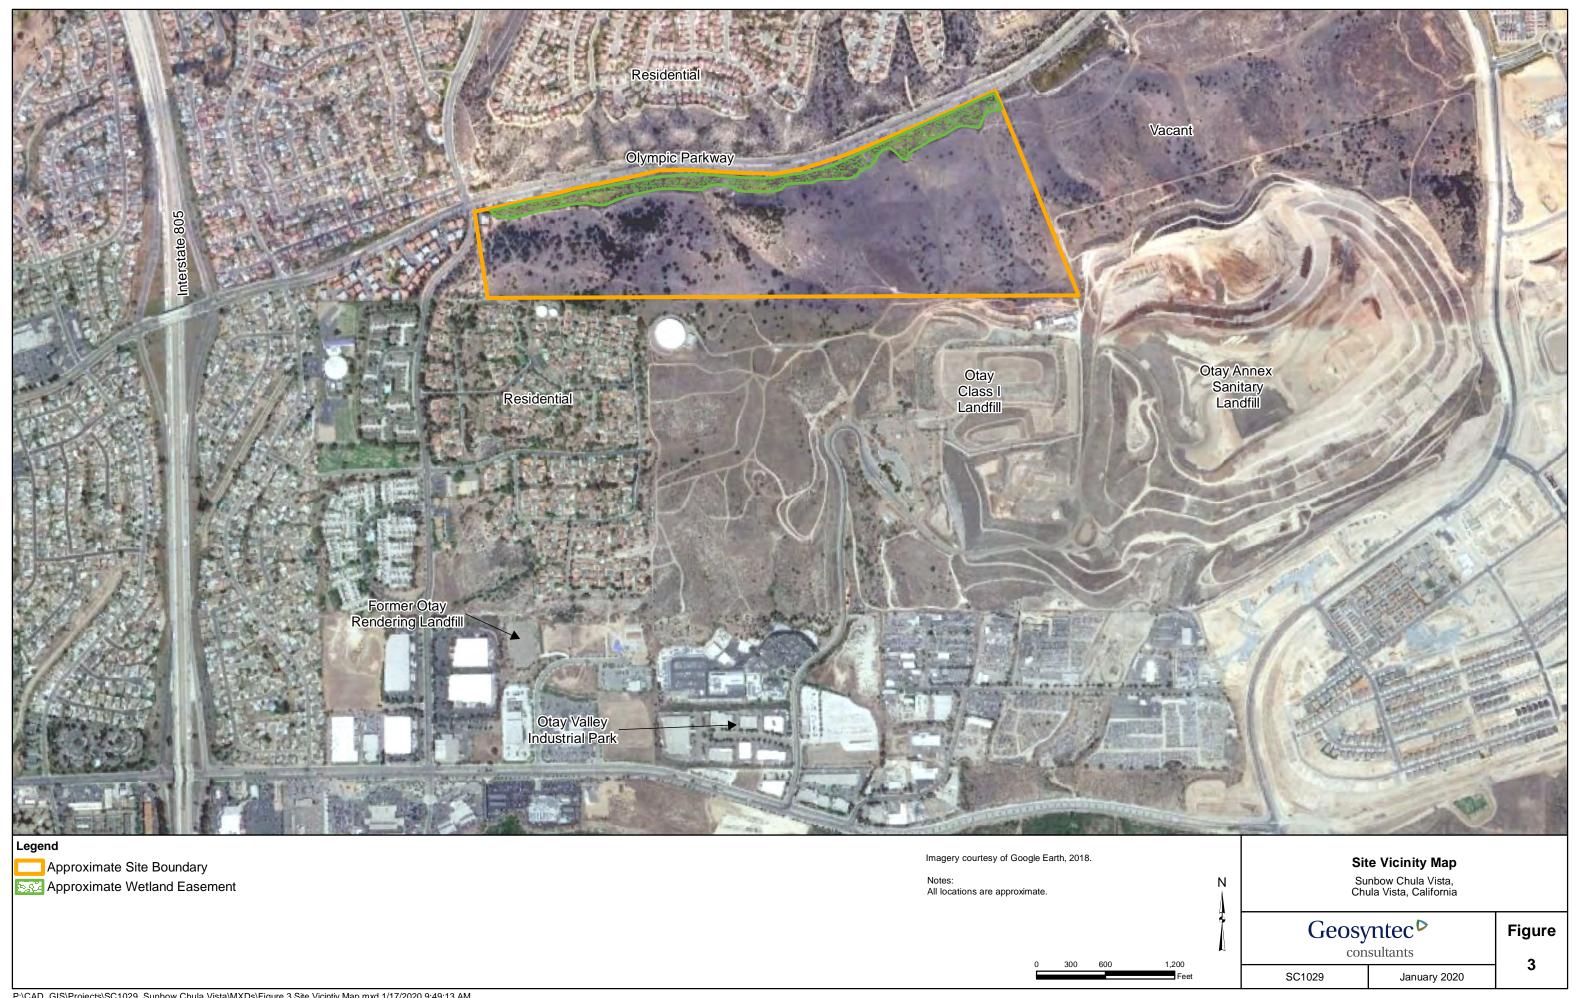

ASTM Section	Feature or Condition	Description	
	reature of Condition	Description	
General Site Setting			
9.4.1.1 & 9.4.1.2	Current and Former Property Usage	The Site is currently vacant and undeveloped. It has been vacant and undeveloped since at least 1949, according to historical aerial photographs.	
9.4.1.3 & 9.4.1.4	Current and Former Adjoining Property Usage	Currently adjoining the Site to the north is Olympic Parkway, followed by vacant land and residential developments. The property adjoining the Site to the east-northeast is vacant, and the property to the east-southeast contains a portion of the Otay Class III landfill. The property adjoining the Site to the south contains the Otay Class I landfill, property associated with the Class III landfill, and residential developments to the south and southwest. The property to the west of the Site is developed with residences and Brandywine Avenue. The adjoining land has historically been vacant to the north, east, and west, prior to its current development, and landfill operations began at the properties to the south around 1963 after the area was mined for bentonite.	
9.4.1.5	Current and Former Use of Surrounding Area	Currently, the site vicinity to the north is developed with residential subdivisions, a shopping center, and medical center. The area east and southeast of the Otay Class III landfill was historically undeveloped native land until around 2011 when those areas started undergoing residential development (some of which are still undergoing construction). The Site vicinity in the area south of the landfills has been used for a range of agricultural, commercial, and industrial purposes (dairy/feedlots, auto recycling yards, auto sales lots, reclaimed aggregate yard, and various multitenant commercial buldings) since at least the 1940s.	
9.4.1.6	Geology, Hydrogeology, Hydrology, Topography of Site and Adjoining Properties	The Site is directly underlain by the San Diego Formation, then the Otay Formation, followed by the Mission Valley (Sweetwater) Formation. The San Diego Formation consists of Plioceneaged conglomerate and marine sandstone. Bentonitic clay and claystone are encountered in shallow soils at the Site. The Otay Formation consists of marine or shallow bay deposits of mudstone, silt, sand, thin gravel layers, and volcanic ash; this volcanic ash has been altered to bentonite clay in some areas, including the footprint of the landfills to the south. The Mission Valley/Sweetwater Formation consists of clay and claystone with sand, silt, and gravel beds. The decreasing topographic gradient of the Site is to the north, with large native hills in the southern portion sloping down to the streambed along the northern perimeter. The hill then slopes down south of the Site to the landfills. The ridge along the southern portion of the Site continues to the east and west, and slopes down to the west to Brandywine Avenue.	
9.4.1.7	Onsite Structures	No structures exist onsite.	
9.4.1.8	Roads and Parking Areas	No roads or parking areas exist onsite. Several unpaved paths were noted from foot and offroad vehicle traffic.	
9.4.1.9	Potable Water supply	No potable water supply currently exists to the Site.	
9.4.1.10 & 9.4.4.7	Sewage Disposal or Septic Systems	No sewage disposal systems or septic systems were observed onsite.	
Interior and Exterior Ob	0 1 1 7		
9.4.2.3 & 9.4.2.8	Hazardous Substances or Petroleum Products	No hazardous substances or petroluem products were observed onsite.	
9.4.2.4	Underground Storage Tanks	No evidence of underground storage tanks was observed onsite.	
9.4.2.4	Above-ground Storage Tanks	No above-ground storage tanks were observed onsite.	
9.4.2.5	Odors	Odors related to active landfilling operations on the adjoining Class III landfill were noted at the Site.	
9.4.2.6	Pools of Liquids	No pools of liquids were observed at the Site.	
9.4.2.7	Drums and Containers > 5 Gallons	No drums or containers greater than five gallons were observed at the Site.	
9.4.2.9	Unidentified Substances/Containers	No unidentified substances or containers were observed at the Site.	
9.4.2.10	PCB Items	No PCB items were observed a the Site. One pad-mounted transformer was observed in the right-of-way directly south of Olympic Parkway north of the northeastern corner of the Site. No PCB stickers were observed on the transformer.	
Interior Observations			
9.4.3.1	Heating and Cooling Systems	No buildings are currently onsite.	
9.4.3.2	Stains/Corrosion	No buildings are currently onsite.	
9.4.3.3	Drains and Sumps	No buildings are currently onsite.	
Exterior Observations	ln: n t t		
9.4.4.1	Pits, Ponds, or Lagoons (Onsite and Adjoining)	No pits or lagoons were observed onsite or on adjoining properties. Ponded water was observed intermittently in conjunction with the stream discussed below under stormwater discharge.	
9.4.4.2	Stained Soil or Pavement	No stained soil or pavement was observed.	
9.4.4.3	Stressed Vegetation	No stressed vegetation was observed.	
9.4.4.4	Solid Waste	One mattress and a dilapidated couch were observed on the Site. Small pieces of debris that appeared to have been blown onto the Site by the wind were observed.	
9.4.4.5	Wastewater or Stormwater Discharge	No wastewater is generated a the Site. Stormwater flows to a shallow, flowing stream flowing east-west along the northern perimeter of the Site within a designated wetland (which appears to be a continuation of the Poggi Canyon Creek). The streambed was approximately 15 feet deep and approximately 100 feet wide and filled with plants typically associated with wetlands.	
9.4.4.6	Wells	Several stickup and flush-mount monuments were observed in the southeastern portion of the Site corresponding to gas probes and/or monitoring wells instaklled during previous investigations performed at the Site in the 1990s. These monuments were locked and unable to be opened to confirm, and are not noted on current or historical monitoring well or gas probe location maps for the adjoining landfills.

Environmental Liability Valuation
Hazardous Materials Site Investigations
Hydrogeologic Field Investigations
Contaminated Site Mitigation/Remediation
Hazardous Materials Management
Landfill Characterizations and Mitigation
Litigation Support

CAREER SUMMARY

Mr. Wittig possesses a varied background in the geological and environmental sciences and has more than 28 years of diverse experience in planning, conducting, and managing multi-disciplinary due diligence projects involving Phase I Environmental Site Assessments (ESAs), contaminant investigations, vapor intrusion studies, human health risk assessments, engineering feasibility studies, environmental liability evaluations, mitigation of environmentally impaired properties, regulatory coordination, and litigation support for a variety of private and public sector clients.

Environmental Assessment and Due Diligence Services

Mr. Wittig has conducted and/or managed more than 200 Phase I ESAs throughout the USA and Mexico between 1992 and the present in accordance with ASTM standards to evaluate the presence of Recognized Environmental Conditions (RECs) associated with the subject properties. The Phase I ESAs have involved a variety of complexities and property usages ranging from rural native land to highly-impacted industrial properties with more than a century of historical activity. Several of these projects involved linear features such as pipeline or rail corridors, multiple-site portfolios and/or very large acreages. The range of properties assessed includes:

- Electricity generating/transmission facilities
- Petroleum distribution facilities/pipelines
- Aviation/aerospace manufacturing
- Pesticide manufacturing/distribution
- Concrete and asphalt production/distribution
- Agricultural activities, livestock, and dairies
- Commercial wholesale and retail activities
- Biosolids processing and composting
- Schools
- Stadiums

- Industrial manufacturing facilities
- Apparel manufacturing
- Rail and transit facilities
- Mining and aggregate processing
- Plating shops
- Salvage yards
- Dry cleaners
- Service stations
- Landfills and burn dumps
- Former military facilities

Based on the results of Phase I ESAs, additional due diligence services include Phase II site characterizations to assess impacts resulting from historical activities. Activities conducted

include surface geophysical surveys; hazardous materials surveys and abatement (asbestos, lead-based paint, universal waste); soil, soil vapor, groundwater and surface water assessments; vapor intrusion assessments and mitigation; human health risk assessments; feasibility studies; developing estimated site cleanup costs and liability valuation; developing cleanup goals based on the current and/or future intended site usage; strategic project support for development of contaminated properties; regulatory support and coordination; and litigation support.

Examples of the range of due diligence services provided by Mr. Wittig include:

Confidential Home Improvement Retailer, Phase I and Phase II Environmental Site Assessments, Various Locations. Since 2003 Mr. Wittig has provided due diligence services for more than 75 properties comprising Phase I ESAs in accordance with current ASTM E 1527 Standard Practice for ESAs, Phase II site characterizations, hazardous materials abatement, mitigation/remediation, and monitoring and reporting. Projects included single properties to 25 sites throughout 8 states. The services are provided through counsel on a privileged and confidential basis.

Programmatic Due Diligence Services, San Diego Gas & Electric, San Diego County, California. Directs a broad range of due diligence services including Phase I ESAs, Phase II site characterization and vapor intrusion studies, risk assessments, and remediation for existing and future facilities including substations and administrative facilities.

Phase I ESA Portfolio, Foundation Windpower, Four Industrial Facilities Throughout California. To assist in the risk management for construction of four windmill turbines, Mr. Wittig directed four Phase I Environmental Site Assessments on an expedited basis at facilities spanning California. Facilities included an Anheuser Busch brewery, wastewater treatment plant, agricultural packing house, and casino. The scope of work was successfully completed within two weeks.

Sunrise Powerlink, San Diego and Imperial Counties, California. Mr. Wittig directed a Phase I ESA of the 120-mile project alignment to fulfill the compliance requirements in the EIR approved by the California Public Utilities Commission, and was presented in a concise, user-friendly, interactive report. Following completion of the Phase I ESA, Mr. Wittig directed a team of 15 to 20 staff during the completion of numerous Phase I ESA Addenda, Phase II investigations to further investigate RECs identified during the Phase I ESA and evaluate liability associated with documented environmental issues; remediating mitigation properties; and environmental compliance construction monitoring services.

Phase I Environmental Site Assessment and Phase II Site Characterization, Four Corners Generating Station, Southern California Edison, New Mexico. Mr. Wittig directed a comprehensive due diligence assessment for the Four Corners Generating Station (FCGS), a coal-burning power plant located in northwestern New Mexico on land leased by the Navajo Nation. Geosyntec was contracted to perform a suite of due diligence services for the site to evaluate the

potential environmental liabilities associated with the possible sale of the client's interest in the FCGS. Services included a large-scale Phase I ESA for the site, a comprehensive Phase II Site Characterization which included advancement of more than 70 soil borings and collection of groundwater, sediment, and surface water samples. The final report included a comprehensive summary of findings for the due diligence investigation, a site conceptual model based on site specific findings and historical records, and an environmental liability valuation for consideration during the divestiture process.

San Onofre Nuclear Generating Station, Fran and Gary Distribution Facilities, Phase I ESA, Southern California Edison, San Diego County, California. Following closure of the San Onofre Nuclear Generating Station (SONGS), Southern California Edison (SCE) sought to divest certain portions of electrical transmission infrastructure to San Diego Gas & Electric (SDG&E). As a long-time consultant to both parties, Geosyntec was mutually selected to conduct an impartial Phase I ESA of a portion of the SONGS facility. Mr. Wittig directed a Phase I ESA in accordance with ASTM Standard E 1527. Unique considerations included evaluation of groundwater data for radioactivity concerns and evaluation of ongoing decommissioning activities.

Veterans Affairs West Los Angeles Campus, Phase I ESA, Vet's Advocacy, Inc., Los Angeles, California. The VA West LA Campus is an approximately 400-acre property that was established in 1887 as the National Home for Disabled Volunteer Soldiers, and eventually developed as the present-day campus with more than 150 structures, several recreational facilities, numerous parking lots, a college baseball stadium, a portion of a school, a landfill, and an active oil lease. Mr. directed the preparation of a Phase I ESA for the entire campus on an expedited basis.

Due-Diligence Evaluation, Class I Landfill, Central California. Mr. Wittig coordinated a team of engineers and environmental scientists in the due-diligence evaluation for a potential buyer of the active Class I disposal facility. Due diligence efforts included detailed evaluation of the landfill design, LCRS system, remaining airspace, history of regulatory violations, licenses and permits, waste-acceptance procedures, effectiveness of the groundwater monitoring network, annual and lifetime operation and maintenance costs, and pending legal actions by regulatory agencies and opponents of the landfill.

Multiple Turbine Plants, Phase I ESAs, NRG/Dynegy, San Diego County, California. Managed Phase I ESA and Phase II Site Characterization of the former SDG&E gas-fired turbine plants at 32nd Street Naval Station, Naval Air Station North Island, El Cajon, Kearney Mesa, and Miramar on behalf of NRG/Dynegy during pre-acquisition due diligence.

Circuit Board Manufacturing Facility, Poway, California. Mr. Wittig directed a Phase I ESA and compliance evaluation for an operating circuit board manufacturing facility. The facility included evaluation of a 70,600 square-foot structure including plating baths for more than 40 hazardous substances, an intricate secondary containment and sump conveyance system,

wastewater treatment systems, and waste management protocols. Following completion of the property transaction, Mr. Wittig assisted the Europe-based client with regulatory coordination and the process of transferring operational permits from the prior owner.

Otay Mesa Generating Project, Pacific Gas & Electric, San Diego, California. Performed a Phase I ESA to identify potential environmental liabilities associated with the property; coordinated dozens of contractors and local, State and Federal regulatory agencies, and tracked environmental compliance tasks specified by the California Energy Commission. Environmental compliance tracking included biological, cultural and paleontological resources, air and water quality, noise, stormwater management and erosion control, and hazardous materials handling services related to construction and operation of a 510-MW natural-gas-fired power plant.

Phase I/Phase II Environmental Assessments, MTDB Light-Rail Extension, San Diego, CA. Mr. Wittig performed a Phase I ESA to identify potential sources of contamination within a 1,000-foot-wide corridor along a 3.2-mile-long railway right-of-way in downtown San Diego, conducted a Phase II subsurface investigation along the length of the right-of-way and focused on a depressed section of the light-rail extension in an area with significant subsurface hydrocarbon impacts resulting from bulk storage facilities and retail service stations.

Due Diligence-Related Litigation Support Experience

Greenfield MHP Associates, L.P., et al. v. Ametek, Inc., et al. Technical lead in support of testifying expert representing co-defendants in a matter pertaining to the due diligence efforts, and remediation methods and associated costs for chlorinated solvent plume beneath a mobile home park in southern California. Managed review of hundreds of historical documents and worked closely with the testifying expert in the preparation of expert reports

Otay Land Company, et al. v. U.E. Limited, L.P, et al. Technical lead in support of testifying expert represented defendants in a matter pertaining to due diligence efforts, the characterization and remediation related to the nature, extent and costs associated with residual lead, polyaromatic hydrocarbons and perchlorate at a former trap and skeet range in southern San Diego County.

JMS Acquisition v. Bayfront Plaza, LLC. Represented defendant on issues associated with due diligence, site characterization, and proposed remedial action associated with impacts from former dry-cleaning operations. Prepared expert and rebuttal reports, and deposition testimony.

Confidential Client, Encinitas, CA. Working closely with legal counsel on behalf of the current property owner, performed historical research to identify the responsible party and source of subsurface chlorinated solvent impacts at the site which previous due diligence failed to identify. Subsequently evaluated vapor intrusion concerns, and mitigation/remediation alternatives.

Cashay, LLC, et al v. V.D.M., Inc. et al. Represented defendant with issues associated with due diligence, site characterization, and impacts from former dry-cleaning operation.

Memorandum

Date: 20 February 2020

To: Jennifer Chavez, Sheppard, Mullin, Richter & Hampton LLP

From: Veryl Wittig, PG, CHG, Geosyntec Consultants

Subject: Soil Vapor Investigation Summary

Sunbow Proposed Development

Chula Vista, California

Geosyntec has prepared this technical memorandum (memo) summarizing the results of the limited soil vapor investigation conducted at the approximately 136-acre property comprised of two parcels in the City of Chula Vista with Assessor's Parcel Numbers 644-011-06-00 and 644-020-11-00 (i.e., the "site"; Figure 1). The investigation was conducted in support of Lennar's prepurchase due diligence process, and was conducted to address potential environmental concerns related to the operating Republic Services Otay Mesa Class III Landfill located adjoining south and southeast of the site (Figure 2). The potential environmental concerns were identified during a Phase I Environmental Site Assessment (ESA) recently conducted for the site.

BACKGROUND AND OBJECTIVE

Portions of the Otay Class III Landfill adjoin the site to the south and southeast, and the Otay Class III landfill surrounds the adjoining Otay Class I Landfill (Figure 2). Both the Class I and Class III landfills have groundwater monitoring networks, which are monitored semiannually under orders issued by the San Diego Regional Water Quality Control Board (SDRWQCB). Groundwater flow at both landfills is generally to the south-southwest away from the site, and there are no indications of groundwater impacts beneath the site attributable to the two adjoining landfills. The Class III landfill is equipped with a landfill gas control system (LFGCS) and a perimeter probe monitoring network that is routinely monitored under the direction of the County of San Diego Local Enforcement Agency (LEA). Methane has not been detected above 1% by volume at the perimeter probes closest to the Site.

A draft Phase I Environmental Site Assessment (ESA) was prepared for the site in January 2020, which revealed no evidence of recognized environmental conditions (RECs) in connection with the site. However, the following REC was identified in the draft Phase I ESA report:

"Historical investigations performed in the 1990s to assess potential impacts to the site from the adjoining landfill properties identified subsurface methane which had migrated beneath the site

Soil Vapor Investigation Summary 20 February 2020 Page 2

from the Class III landfill at concentrations up to 3,300 parts per million (ppm) methane, which is more than an order of magnitude lower than the lower explosive limit (LEL) of methane (50,000 ppm, or 5% by volume). As required by Title 27 of the California Code of Regulations, the landfill owner/operator is required to install and operate a LFGCS and install and monitor a network of perimeter monitoring probes. Operation of the LFGCS at the adjoining Class III landfill is ongoing, and methane has not been detected above 1% by volume at perimeter probes closest to the site, and has been detected at concentrations of 0.10% in only two probes since January 2018. Therefore, the engineering controls on the adjoining Class III landfill property appear to be effectively controlling subsurface methane migration from the landfill property to the site."

The absence of recent soil vapor data for the site was noted as a data gap in the draft Phase I ESA. Available data for the Class III landfill perimeter monitoring network indicates that gas concentrations at the landfill boundary adjoining the site are below regulatory thresholds, and historical data collected at the site in the 1990s indicated that the methane LEL in the subsurface was not exceeded. However, recent data regarding the potential presence of volatile organic compounds (VOCs; e.g., benzene, tetrachloroethene [PCE], trichloroethene [TCE]) commonly associated with landfill gas are not available to evaluate potential vapor intrusion concerns for future structures planned for construction at the site. Therefore, the objective of the investigation described herein was to address this data gap by conducting a soil vapor survey at the site to evaluate current onsite subsurface soil vapor conditions and potential subsurface impacts attributable to the adjoining Otay Class III landfill.

METHODOLOGY

Temporary Soil Vapor Probe Construction

Five triple-nested soil vapor probes (SVPs) were constructed using a track-mounted direct-push drilling rig on 24 January 2020 near the perimeter of the property, where the site adjoins the Otay Class III landfill (Figure 3). The triple-nested SVPs were constructed inside 2-inch diameter borings with probes at 5 and 10 feet below ground surface (ft bgs). Four of the five SVPs (SVP-1 through SVP-4) had their deepest probe installed at 19.5 ft bgs. Due to refusal encountered at a depth of 15 feet in SVP-5, the deepest probe at that location was 15 ft bgs.

Each probe interval consists of a 6-inch long by ½-inch diameter stainless-steel-screened vapor probe with dedicated ¼-inch Teflon tubing extending to the ground surface. An approximately 1-foot interval of the borehole surrounding the probe (i.e., approximately 3 inches above and below the vapor probe screen) was backfilled with clean #3 sand. Approximately 6 inches of dry granular bentonite was placed above the sand layer, followed by placement of hydrated bentonite to create a seal between the probe intervals. The remainder of the borehole above the upper probe interval at each location was backfilled with hydrated granular bentonite to the surface.

Soil Vapor Investigation Summary 20 February 2020 Page 3

Soil Vapor Sampling Methodology

The SVPs were sampled on 27 January 2020 in general accordance with the current State of California Department of Toxic Substances Control (DTSC) Advisory for Active Soil Gas Investigations (DTSC Advisory) [DTSC, 2015]. Leak checks involving "shut-in" and tracer tests were performed using a conservative tracer gas (e.g. helium) to monitor that fittings in the sampling train did not leak at an applied vacuum of up to 100 inches of water column. After leak checks were performed (and any leaks detected were remedied), three 'dead space' pore volumes were purged prior to sample collection. Field screening of vapor samples to assess subsurface fixed gas concentrations (i.e., methane, oxygen, and carbon dioxide) was conducted using a LANDTEC® GEM5000 landfill gas monitor.

Soil-vapor samples were collected in 1-Liter Tedlar[®] bags and forwarded to Eurofins Calscience, Inc. (Calscience) of Garden Grove, California, a California Department of Public Health (CDPH) Environmental Laboratory Accreditation Program (ELAP) certified laboratory. Samples were analyzed for VOCs by United States Environmental Protection Agency (EPA) Method TO-15, and for fixed gases (methane, carbon dioxide, carbon monoxide, nitrogen, and oxygen + argon) by EPA Method D1946.

RESULTS

Constituents detected in soil vapor samples collected during the investigation are summarized in Table 1, and the associated laboratory analytical report is included as Attachment 1. Detected constituents were compared to San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) Tier 1 Environmental Screening Levels for Residential Sub-slab / Soil Gas (Tier 1 ESLs) [SFBRWQCB, 2019]. These screening levels are based on an excess lifetime cancer risk (ELCR) of "one-in-a-million" (denoted as 1x10⁻⁶) as an acceptable risk level, and were derived based on a generic conservative conceptual site model designed for use at most sites for site screening purposes. If a Tier 1 ESL has not been established for a given analyte, then the analytes were compared to their respective EPA Regional Screening Levels (RSLs) for indoor air quality in a residential setting [EPA, 2019]. To calculate an EPA RSL for sub-slab / subsurface soil vapor using the EPA RSL for residential indoor air, the conservative default 0.03 attenuation factor (recently adopted for use by the SFBRWQCB) was applied. To calculate an EPA RSL, the 0.03 attenuation factor is divided into the analyte's RSL for indoor air. For example, the EPA RSL for TCE in residential indoor air is 0.48 µg/m³. Applying the conservative default attenuation factor of 0.03 results in an EPA RSL of 16 µg/m³ for samples collected from sub-slab / subsurface soil vapor. Similar to Tier 1 ESLs, the 0.03 attenuation factor is generally applied for conservative site screening purposes to determine if additional assessment is warranted.

In general, the presence of a constituent in soil vapor at a concentration below the Tier I ESLs can be assumed to not pose a significant health risk for residential receptors. Likewise, the presence of a constituent in soil vapor at a concentration above the Tier I ESLs does not indicate that adverse

Soil Vapor Investigation Summary 20 February 2020 Page 4

impacts to human health are occurring or will occur in the future, but may indicate that additional evaluation of potential risk to human health is warranted.

The following analytes were detected during the investigation in excess of their respective Tier 1 ESL or EPA RSL (using the conservative default 0.03 attenuation factor) for soil vapor samples collected at the site:

- Benzene was detected above the Tier 1 ESL of 3.2 micrograms per cubic meter ($\mu g/m^3$) in six samples, at concentrations ranging from 3.9 $\mu g/m^3$ (SVP1-19.5) to 20 $\mu g/m^3$ (SVP3-19.5);
- Bromodichloromethane was detected above the Tier 1 ESL of $2.5 \mu g/m^3$ in one sample, at a concentration of $5.3 \mu g/m^3$ (SVP3-19.5);
- Chloroform was detected above the Tier 1 ESL of 2.4 μ g/m³ in one sample, at a concentration of 7.0 μ g/m³ (SVP3-19.5); and
- Vinyl chloride was detected above the Tier 1 ESL of $0.32 \,\mu g/m^3$ in one sample, at a concentration of $1.8 \,\mu g/m^3$ (SVP1-5).

Methane was not detected in samples above the laboratory screening level, and was not detected during field screening, indicating that the LFGCS is effectively controlling offsite migration of methane from the landfill.

DISCUSSION

The analytes noted above were detected at concentrations marginally exceeding their respective Tier 1 ESLs or EPA RSLs for sub-slab/subsurface soil vapor in a residential site scenario. However, these screening levels do not account for additional attenuation with depth into the soil column, quality of the overlying concrete slab, or other site-specific factors, and are therefore overly conservative for use at the site. Instead, comparison to default DTSC screening levels (SLs) for future residential structures is more appropriate. Default DTSC-SLs for preliminary screening evaluations differentiate between samples collected from the interval immediately below the slab and samples collected from SVPs screened within the vadose zone, because VOCs in soil vapor at depth are additionally inhibited from upward migration due to inherent properties of the overlying soils (such as permeability and moisture content). Further, the DTSC-SLs for future residential structures more appropriately account for additional attenuation resulting from the use of modern construction methods, earthwork/grading activities, and new, competent concrete slab pours.

Recent communication with DTSC indicates that DTSC intends to continue to recommend use of their default attenuation factor of 0.001 for the subsurface-to-indoor pathway for new residential construction [DTSC, 2011]. To calculate a DTSC-SL for future residential structures, this attenuation factor is applied to the corresponding DTSC-modified screening levels for residential indoor air, many of which (including benzene) are modified to be additionally conservative

Soil Vapor Investigation Summary 20 February 2020 Page 5

compared to EPA RSLs. The calculated default DTSC-SLs for subsurface soil vapor are as follows:

Constituent	Residential Ambient Air Screening Level (µg/m³)	DTSC Recommended Future Residential Attenuation Factor	DTSC-SL for Subsurface Soil Vapor Future Residential Scenario (µg/m³)
Benzene	0.097	0.001	97
Bromodichloromethane	0.076	0.001	76
Chloroform	0.12	0.001	120
Vinyl Chloride	0.0095	0.001	9.5

Using the DTSC-recommended default attenuation factors, no analytes were detected in excess of the calculated DTSC-SLs for subsurface soil vapor beneath future residential structures.

Methane was not detected at measurable concentrations during the investigation. It is Geosyntec's understanding that the City of Chula Vista does not currently have building standards that require building protection systems (such as a vapor barrier with passive sub-slab ventilation) for the new construction of occupied structures within 1,000 feet of a Class III landfill.

SUMMARY AND CONCLUSIONS

The soil vapor investigation conducted on 24 and 27 January 2020 documented methane was not detected in the samples, indicating that the LFGCS is effectively controlling the migration of methane from the adjoining Class III landfill. Low-level concentrations of VOCs were detected in soil vapor samples collected at the site, including four analytes detected in one or more samples at concentrations at concentrations above their respective Tier 1 ESLs or EPA RSLs for a residential site scenario. However, none of these analyte concentrations exceeded calculated DTSC-SLs for future residential construction. Therefore, with the understanding that the adjoining Class III landfill owner/operator will continue to operate the LFGCS in accordance with Title 27 requirements, future earth-moving activities in preparation for site development and construction will likely result in dissipation of residual VOC concentrations in shallow soil vapor, and future structures will be constructed using modern building practices with competent concrete slabs, there is no apparent unacceptable risk to future residential site occupants due to methane and/or VOC-impacted soil vapor.

Notes:

SFBRWQCB SLs - San Francisco Regional Water Quality Control Board (SFBRWQCB) Tier 1 (residential) Environmental Screening Levels (ESLs) for sub-slab / soil vapor, based on a generic conceptual site model designed for use at most sites. USEPA Regional Screening Levels (RSLs) for residential sub-slab / soil vapor (April 2019) used where no Tier 1 ESL has been established. USEPA RSLs were calculated by dividing the RSL for residential indoor air quality by the conservative default 0.03 attenuation factor.

DTSC-SL - California Department of Toxic Substances Control (DTSC) screening level for future residential structures, calculated by applying the default 0.001 attenuation factor for future residential indoor air, whichever is more conservative.

Values in **bold** were detected above the SFBRWQCB SL but below the DTSC-SL

RL - laboratory reporting limit

μg/m³- micrograms per cubic meter

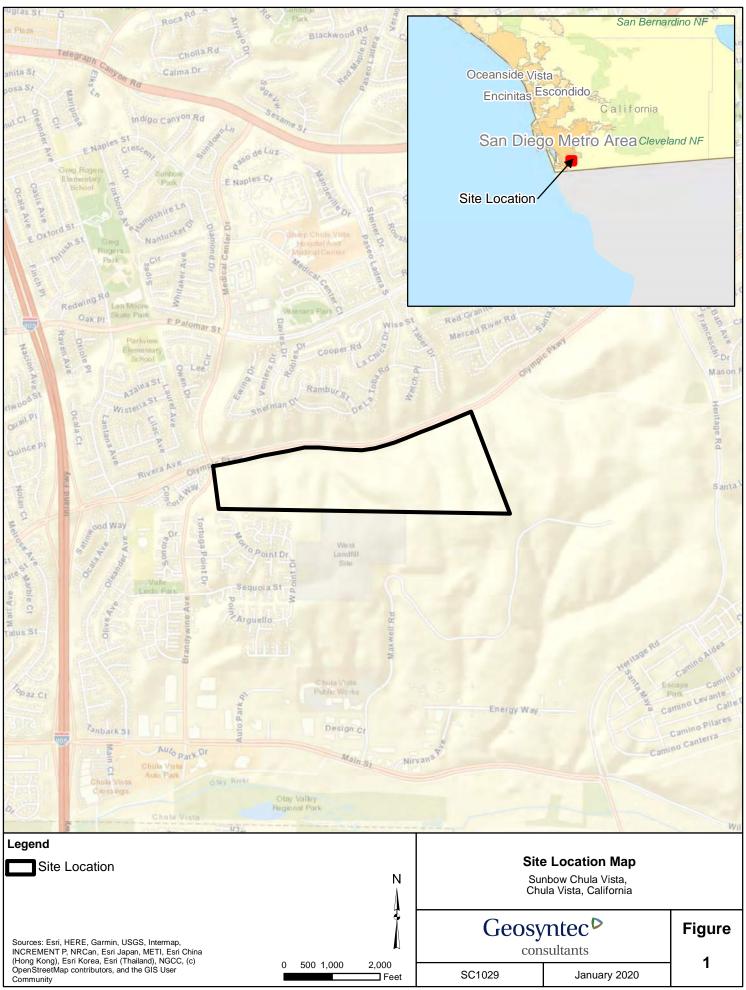

% v/v - percent volume per volume

NE indicates there is not an established SFBRWQCB ESL, USEPA RSL, or DTSC-SL for this analyte

ND indicates compound was not detected at the laboratory reporting limit (RL)

Samples were analyzed for volatile organic compounds (57 compounds) by USEPA Method TO-15

Only analytes detected in one or more sample above the RL are shown

Definitions/Glossary

Client: Geosyntec Consultants, Inc.

Job ID: 570-19024-1

Project/Site: SC1029-02

Qualifiers

Air - GC/MS VOA

J Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
n	Listed under the "D" column to designate that the result is reported on a dry weight basis

%R Percent Recovery
CFL Contains Free Liquid
CNF Contains No Free Liquid

DER Duplicate Error Ratio (normalized absolute difference)

Dil Fac Dilution Factor

DL Detection Limit (DoD/DOE)

DL, RA, RE, IN Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample

DLC Decision Level Concentration (Radiochemistry)

EDL Estimated Detection Limit (Dioxin)

LOD Limit of Detection (DoD/DOE)

LOQ Limit of Quantitation (DoD/DOE)

MDA Minimum Detectable Activity (Radiochemistry)
MDC Minimum Detectable Concentration (Radiochemistry)

MDL Method Detection Limit
ML Minimum Level (Dioxin)

NC Not Calculated

ND Not Detected at the reporting limit (or MDL or EDL if shown)

PQL Practical Quantitation Limit

QC Quality Control

RER Relative Error Ratio (Radiochemistry)

RL Reporting Limit or Requested Limit (Radiochemistry)

RPD Relative Percent Difference, a measure of the relative difference between two points

TEF Toxicity Equivalent Factor (Dioxin)
TEQ Toxicity Equivalent Quotient (Dioxin)

Comments

No additional comments.

Receipt

The samples were received on 1/27/2020 7:10 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 22.0° C.

Air Toxics

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Records Search Summary

Company: Geosyntec Consultants

Project Name: Chula Vista

Attention: Rosemary Propst

Street Address of Property: Olympic Parkway

Chula Vista, CA

APN's 644-011-06-00 & 644-020-11-00

San Diego County Hazardous Materials Management Division

E-mailed request: 12-23-19, Contact: Edwin Andrus

ESS submitted a request for a records search concerning Olympic Parkway, Chula Vista, CA, APN's 644-011-06-00 & 644-020-11-00 to Mr. Andrus, with the San Diego County Hazardous Materials Management Division (See Appendix B). ESS requested information concerning the utilization, manufacture, storage and/or discharge of hazardous materials/waste, and any information concerning previous or on-going site investigations/remediations pertaining to hazardous materials/waste. He informed ESS December 26, 2019 that his department had no records for Olympic Parkway, Chula Vista, CA, APN's 644-011-06-00 & 644-020-11-00 (See Appendix B).

Department of Toxic Substances Control (DTSC) – Cypress Office

E-mailed request: 12-23-19, Contact: Julie Johnson/Jone Barrio

Previous contacts with the DTSC have disclosed that this office only collects and stores information (such as treatment, storage and disposal of hazardous waste) concerning sites which have existing businesses, industries, etc. present. **ESS** requested that Ms. Johnson/Ms. Barrio, with the DTSC, check the file room records for any files/information the concerning Olympic Parkway, Chula Vista, CA, APN's 644-011-06-00 & 644-020-11-00 (See Appendix C). Ms. Barrio informed **ESS** on December 26, 2019 that her department had no files/information concerning the Chula Vista site (See Appendix C).

Department of Toxic Substances Control (DTSC) – Chatsworth Office

E-mailed request: 12-23-19, Contact: Glenn Castillo/Robert Hardison

Previous contacts with the DTSC have disclosed that this office only collects and stores information (such as treatment, storage and disposal of hazardous waste) concerning sites which have existing businesses, industries, etc. present. **ESS** requested that Mr. Castillo/Mr. Hardison, with the DTSC, check the file room records for any files/information concerning Olympic Parkway, Chula Vista, CA, APN's 644-011-06-00 & 644-020-11-00 (See Appendix D). Mr. Hardison informed **ESS** on December 26, 2019 that his department had no files/information concerning the Chula Vista site (See Appendix D).

Department of Toxic Substances Control (DTSC) – San Diego Office

E-mailed request: 12-23-19, Contact: Public Records Section

Previous contacts with the DTSC have disclosed that this office only collects and stores information (such as treatment, storage and disposal of hazardous waste) concerning sites which have existing businesses, industries, etc. present. **ESS** requested that the Public Records Section, with the DTSC, check the file room records for any files/information concerning Olympic Parkway, Chula Vista, CA, APN's 644-011-06-00 & 644-020-11-00 (See Appendix E). Beatriz Davila, with that department informed **ESS** on December 26, 2019 that you must provide a site name or street address to run a search with the Department of Toxic Substances Control (DTSC) – San Diego Office (See Appendix E).

City of Chula Vista Fire Department

On-line request: 12-23-19, Contact: Public Records Section

ESS requested that the Public Records Section, with the City of Chula Vista Fire Department, check their records concerning the storage of hazardous materials/waste and underground storage tanks with regards to the following: Olympic Parkway, Chula Vista, CA, APN's 644-011-06-00 & 644-020-11-00 (See Appendix F). Tamisha Woods, with that department informed ESS on December 27, 2019 that her department had no records for Olympic Parkway, Chula Vista, CA, APN's 644-011-06-00 & 644-020-11-00 (See Appendix F).

Cal Fire - Office of the State Fire Marshal

E-mailed request: 12-23-19, Contact: Pubic Records Request

ESS requested that the Public Records Section, with Cal Fire - Office of the State Fire Marshal, check their records concerning the storage of hazardous materials/waste, pipelines and underground storage tanks with regards to the following: Olympic Parkway, Chula Vista, CA, APN's 644-011-06-00 & 644-020-11-00 (See Appendix G). Anne Hennigan, with that department informed **ESS** on January 2, 2020 that her department did have records for the Chula Vista site (See Appendix G).

Chula Vista Public Works Department – Industrial Waste

On-line request: 12-23-19, Contact: Public Records Section

ESS requested that the Public Records Unit, with the Chula Vista Public Works Department – Industrial Waste, check their records for any information concerning industrial waste discharge permits or violations for Olympic Parkway, Chula Vista, CA, APN's 644-011-06-00 & 644-020-11-00 (See Appendix H). Tamisha Woods, with that department informed ESS January 2, 2019 that she needed an extension until January 16, 2020 to complete ESS' request (See Appendix H).

Chula Vista Building Department

On-line request: 12-23-19, Contact: Public Records Section

ESS requested that the Public Records Section, with the Chula Vista Building Department, provide the building records (all permits and certificates of occupancy) for Olympic Parkway, Chula Vista, CA, APN's 644-011-06-00 & 644-020-11-00 (See Appendix I). Tamisha Woods, with that department informed ESS on December 23, 2019 that her department had no records for Olympic Parkway, Chula Vista, CA, APN's 644-011-06-00 & 644-020-11-00 (See Appendix I). No further information concerning the site was obtained from the building department at the time of the investigation

San Diego Air Pollution Control District (SDAPCD)

E-mailed request: 12-23-19, Contact: Cynthia Gould

ESS submitted a search request concerning active, inactive and sold files for Olympic Parkway, Chula Vista, CA, APN's 644-011-06-00 & 644-020-11-00 to Ms. Gould at the SDAPCD (See Appendix J). She informed ESS December 30, 2019 that her department had no such records for Olympic Parkway, Chula Vista, CA, APN's 644-011-06-00 & 644-020-11-00 (See Appendix J).

Regional Water Quality Control Board (RWQCB) - San Diego Region

E-mailed request: 12-23-19, Contact: Public Records Unit

ESS requested that the Public Records Unit, with the RWQCB, provide the files for Olympic Parkway, Chula Vista, CA, APN's 644-011-06-00 & 644-020-11-00 (See Appendix K). Leah Lorch, with that department informed ESS January 6, 2019 that her department had no such records for Olympic Parkway, Chula Vista, CA, APN's 644-011-06-00 & 644-020-11-00 (See Appendix K). No further information was obtained from the RWQCB at the time of the investigation.

Attachments: 00105855-996_Plots.pdf

Hi Shannon,

I hope you're well, and having a good holiday week! We recently were authorized for a new Phase I down here in San Diego and are looking to do a records search for the property. Could you please contact the applicable agencies for the parcels with APNs 644-011-06-00 & 644-020-11-00, with the associated parcel address 0 Olympic Parkway, Chula Vista, CA 91911? There is no "official" address for the Site as it's undeveloped, but a map is attached. Additionally, will this be for the standard \$350 or do you foresee any additional costs associated with these records searches? Please let me know if so and we'll accommodate. Thank you!

Happy holidays!

Best,

Rose Propst Senior Staff Professional

Dear Ms. Shannon Castagno:

We have received your Public Records Act Request for records from Department of Toxic Substances Control. To complete and process your request, we will need more information. We need a specific site name or addresses. Our database/filling system is not set up to locate the information you are requesting.

We would like to inform you about Envirostor, a database that provides information and documents on over 5,000 DTSC cleanup sites. Envirostor can be accessed at: http://www.envirostor.dtsc.ca.gov/public.

If you have any questions, would like further information regarding your request, please contact our Regional Records Coordinator at (619) 516-1982.

Sincerely,

Beatriz Davila Office Technician

Re: California Public Records Act Request

CPRAR 2019-943/Castagno

Dear Shannon Castagno,

The City of Chula Vista is in receipt of your 12/23/2019 request for the following public records pursuant to the *California Public Records Act* ("CPRA") (Cal. Gov. Code section 6250 *et seq.*):

"Site: Olympic Parkway, Chula Vista, CA 91911, APNs 644-011-06-00 & 644-020-11-00. ESS requests the following information: Underground Storage Tank and Hazardous Materials Records"

I have been informed by staff that there are no responsive records to your request. I have also been informed by staff that they believe that they have fully responded to your request; however, if you need additional information I will assist you in your efforts pursuant to Government Code section 6253.1.

Sincerely,

Tamísha Woods

Dear Public Records Request,

Environmental Support Services (ESS) is in the process of conducting a records search for an environmental audit at a site in Chula Vista, CA. This search includes researching the history of the site, especially as it pertains to hazardous materials/waste. With this in mind, **ESS** requests the following information concerning the subject address which your agency may have on file:

- 1. utilization, manufacture, storage, or discharge of hazardous materials/waste.
- 2. previous or on-going site investigations/remediations pertaining to hazardous materials/waste.
- 3. hazardous materials disclosures concerning the site.
- 4. pipelines.
- 5. information regarding underground storage tank present or previously found at the site.

Should you have any questions concerning this request for information, please call. Your expedient processing of this request is appreciated.

Sincerely,

Environmental Support Services

Re: California Public Records Act Request

CPRAR 2019-944/Castagno

Dear Shannon Castagno,

The City of Chula Vista is in receipt of your 12/23/2019 request for the following public records pursuant to the *California Public Records Act* ("CPRA") (Cal. Gov. Code section 6250 et seq.):

"Site: Olympic Parkway, Chula Vista, CA 91911 APNs 644-011-06-00 & 644-020-11-00. ESS requests the following information: copies of applications and permits for industrial waste discharge; and copies of any and all violations."

Please be advised, your request requires the need to search for, collect, and appropriately examine a number of separate and distinct records that are demanded in a single request; therefore, pursuant to the provisions of Government Code section 6253(c), the City is asserting its authority to extend the time to reply. This assertion of the City's authority to extend the time to reply shall not serve as a waiver of any privileges or exemptions to disclosure pursuant to applicable provisions of the CPRA and any other applicable statutory and/or case law authority.

In light of the above, this office will respond to your request on or before 1/16/2020 to inform you of when responsive records may be available. Thank you in advance for your patience and anticipated consideration regarding this matter.

Should you have any questions please feel free to contact me at (619) 409-5961.

Sincerely,

Tamísha Woods

Re: California Public Records Act Request

CPRAR 2019-944/Castagno

Dear Shannon Castagno,

The City of Chula Vista is in receipt of your 12/23/2019 request for the following public records pursuant to the *California Public Records Act* ("CPRA") (Cal. Gov. Code section 6250 et seq.):

"Site: Olympic Parkway, Chula Vista, CA 91911 APNs 644-011-06-00 & 644-020-11-00. ESS requests the following information: copies of applications and permits for industrial waste discharge; and copies of any and all violations."

The City has identified records responsive to your request. The records that have been identified and are responsive are being sent to you electronically.

I have been informed by staff that they believe that they have fully responded to your request; however, if you need additional information I will assist you in your efforts pursuant to Government Code section 6253.1.

Should you have any questions please contact me at (619) 409-5961.

Regards,

Tamísha Woods

P:\C\City of Chula Vista\Phase P\City of Chula Vista Sunbow Phase I FINAL- Revised.doc

1.0 SUMMARY OF CONCLUSIONS

Subject to the qualifications and limitations stated in Chapter 2.0 (Introduction), ENVIRON International Corporation (ENVIRON) was retained by the City of Chula Vista to perform a Phase I environmental site assessment (ESA) for two parcels of land (Parcels A and B), located in the City of Chula Vista, San Diego County, California (herein referred to as the "Property"). ENVIRON's assessment was conducted in connection with ACI Sunbow, LLC (Sunbow) and the Ayres Land Company's (Ayres) proposed zoning change and development of the Property as a residential community. This ESA is being completed in connection with a Human Health Risk Assessment to evaluate the potential human health risks associated with the former Hazardous Waste transfer station, the former Class I landfill, and the current Class III Otay Landfill operations located to the east and south of the Property. The ESA described in this report was performed in conformance with the scope and limitations of the American Society of Testing and Materials (ASTM) Practice E1527-00. Any exceptions to, or deletions from, this practice are described in Section 2.4 of this report.

Based on ENVIRON's review, no "recognized environmental conditions," (RECs) or historical RECs (HRECs) as defined by ASTM (see Chapter 2.0), were identified as a result of this ESA. However, pertinent findings that are not representative of RECs (i.e., *de minimis* conditions¹) are presented below:

• The area in the nearby vicinity of the Property consists predominantly of residential developments. The Otay Landfill borders Parcel A to the south and Parcel B consists of the northwestern portion of the Otay Landfill area (but has not been used for landfilling purposes). The Otay Landfill is a Class III municipal solid waste landfill comprising approximately 464 acres, of which approximately 230 acres are currently permitted for landfilling. It is permitted for disposal of non-hazardous waste, which includes residential and commercial municipal solid waste, inert solid waste, and industrial waste.

Landfill wastes contain significant portions of organic materials that produce a variety of gaseous products, generally referred to as landfill gas (LFG). Anaerobic bacteria thrive

1

The ASTM Standard defines *de minimis* conditions as those that "generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action of brought to the attention of appropriate governmental agencies."

in the oxygen-free environment, resulting in the decomposition of the organic materials and the production of LFG. LFG is composed of a mixture of hundreds of different gases. By volume, LFG typically contains 45% to 60% methane and 40% to 60% carbon dioxide. LFG also includes small amounts of nitrogen, oxygen, ammonia, sulfides, hydrogen, carbon monoxide, and nonmethane organic compounds (NMOCs) such as trichloroethylene, benzene, and vinyl chloride.

Methane, which is less soluble in water and lighter than air, is likely to migrate out of the landfill. LFG is created under the landfill surface and generally moves away from the landfill, either by rising up through the landfill surface or migrating underground to surrounding areas. Three factors influence where gas migrates to, permeability of the landfill and its surrounding areas, diffusion (LFG moves to areas with lower gas concentrations), and pressure (LFG moves to areas of lower pressure; changing weather conditions affect LFG migration).

LFG releases may represent physical (explosion), chemical (substances in ambient or indoor air), and/or physiologic or quality of life (odor) public health concerns for those who live and work near the landfill. Based on ENVIRON's experience with landfilling activities, the potential for migration of LFG to the Property cannot be ruled out and will be addressed in more detail in ENVIRON's health risk assessment being prepared in conjunction with this Phase I ESA.

According to the URS Report, a Class I Landfill site formerly was operated in the vicinity of the Property (approximately 500 feet of the eastern boundary of Parcel B and immediately adjacent to the south of Parcel A) beginning in 1963. The Otay Class III Landfill surrounds the former Class I Landfill. The Class I portion of the landfill occupied approximately 21 acres on the 47-acre County landfill site. According to the URS report, approximately 17 million gallons of liquid hazardous wastes were disposed of in this unlined landfill from 1963 through October 1980. Wastes accepted at this Class I landfill included, but was not limited to, oil and oil/water mixtures; paint and paint sludges; chemical fertilizers; chemical toilet wastes; drilling muds; brines; corrosive pickling liquors; corrosive acids and alkalines; plating wastes; acid wastes; and acid enchants. Based on historic information, approximately 100,000 cubic yards of hazardous solid waste was also disposed at this facility, including, but not limited to, asbestos, oil spill booms, debris, and paint. Reportedly, when the Class I landfill was closed in 1980, a closure plan was prepared and approved by the appropriate regulatory

agencies. As part of the post-closure, ground water monitoring wells are sampled on a regular basis. Ground water monitoring wells are used to establish ground water quality and the ground water flow direction in proximity to both the Class III and former Class I landfills.

According to information provided in the most recent groundwater monitoring report (prepared by GeoLogics Associates, Inc. [GeoLogics], dated October 2004) the ground water flow direction in proximity to the former Class I landfill is toward the west-southwest. Based on this ground water flow direction, monitoring wells OTGW-24, OTGW-25, and OTGW-17 are located generally downgradient of the landfill and upgradient of Parcel B. Based on the most recent ground water sampling data, volatile organic compounds (VOCs) were not detected in ground water in these wells. Assuming that these recent data are indicative of future trends, VOCs have not and likely will not impact ground water underlying Parcel B. Because no VOCs were detected above laboratory detection levels in wells adjacent to Parcel B (downgradient from the former Class I landfill), the potential for off-gassing of VOCs from the ground water to underlying soil gas is considered to be low. Therefore, ENVIRON has no further recommendations for further evaluation of VOCs in ground water underlying or in proximity to Parcel B. Similarly, based on information provided by Ayres, no evidence of the presence of VOCs at Parcel A has been identified.

• Appropriate Technologies II, Inc. (APTEC; approximately 600 feet east of Parcel B and 1,200 feet south of Parcel A) is listed on the "Unconfirmed Properties Referred to Another Agency" (REF) data base as reported by Environmental Data Resources, Inc. (EDR). This data base contains sites at which contamination has not been confirmed and which were determined as not requiring direct Department of Toxic Substances Control (DTSC) Site Mitigation Program action or oversight. Accordingly, these sites have been referred to another state or local regulatory agency. Based on the EDR data base listing, the lead agency for APTEC was turned over from the DTSC to the Environmental Protection Agency (EPA) in 1983 as part of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) screening and assessment activities conducted in 1996. According to the REF data base listing, APTEC was a transfer station for non-hazardous and hazardous liquid sludge and slurry wastes in bulk and hazardous liquid/solid wastes in drums or other approved containers. Waste specifically not accepted at the APTEC facility included polychlorinated biphenyls (PCBs), explosives, and radioactive materials. The listing also indicates that the APTEC

facility was completely surrounded by the Otay Landfill and classified as a hazardous storage and transfer facility zoned for "open space" and park development. Most significantly, the EDR data base listing indicates that there was "no disposal on-site" and that the APTEC facility was solely a temporary storage facility. According to site inspection notes (contained in the data base listing), the facility was "well-run," with "good storage" and housekeeping practices, good security, and "no identified problems." Lastly, no significant objections were noted during public hearing activities during the final DTSC "No Further Action" ruling in 1996 for the APTEC facility. Because this facility was a temporary storage facility and was granted a NFRAP status by the DTSC, it is unlikely that former operations at the APTEC site have adversely impacted the Property.

2.0 INTRODUCTION

2.1 Purpose

ENVIRON was retained by The City of Chula Vista to conduct an ESA of the Property located in Chula Vista, San Diego County, California. ENVIRON's assessment was conducted in connection with Sunbow's and Ayres' proposed zoning change and development of the Property as a residential community. This ESA is being completed in connection with a Human Health Risk Assessment to evaluate the potential human health risks associated with the former Hazardous Waste transfer station, the former Class I landfill, and the current Class III Otay Landfill operations located to the east and south of the Property. The purpose of the assessment was to identify potential RECs and HRECs. The term "REC" is defined by ASTM as:

"The presence or likely presence of any hazardous substances or petroleum products on a site under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products in structures on the site or into the ground, ground water, or surface water of the site. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include *de minimis* conditions that generally do not represent a material risk of harm to public health and environment and that generally would not be the subject of enforcement action if brought to the attention of appropriate governmental agencies."

The term HREC is based on the definition in ASTM E1527-00 and refers to an environmental condition that in the past would have been considered a REC, but has been satisfactorily remediated or addressed in such a manner that it is not considered to be a current REC.

For the purposes of this assignment, "non-scope considerations," as defined in the ASTM standard (i.e., asbestos-containing materials, radon, lead-based paint, lead in drinking water, wetlands, regulatory compliance, cultural and historic resources, industrial hygiene, health and safety, ecological resources, endangered species, indoor air quality, and high voltage power lines), were not addressed, except as noted in Section 2.5 of this report.

2.2 Scope of the Assessment

ENVIRON undertook the following tasks, consistent with the ASTM E1527-00 standard, to complete the assessment of the Property:

- An unescorted visit to the Property by Kristin Thomas of ENVIRON on February 10, 2005, to observe and evaluate visible Property conditions (see Appendix A for photographs).
- A telephone interview with Mr. Paul Lazano and Mr. Jim Ambroso for Otay Landfill, Inc., on April 7, 2005.
- A telephone interview with Mr. Sam Holty of Ayres on February 28, 2005.
- A review the report titled, "Limited Soil-Gas, Soil, and Ground water Sampling Report for Rancho Del Sur Phase II, San Diego, California", dated June 3, 1994, prepared by Geocon Environmental Consultants (Geocon) and provided to ENVIRON by Ayres.
- A review of the report titled, Final Closure and Postclosure Maintenance Plan, Otay
 Class I Landfill, prepared by URS Greiner Woodward Clyde (the "URS Report"), dated
 March 24, 2000.
- A review of the report titled, Water Quality Monitoring Report, Semiannual (April 2004 through September 2004) Report, Otay Landfill, prepared by GeoLogics Associates (the GeoLogics Report), dated October 2004.
- Historical fire insurance maps covering the Property and vicinity were requested but, according to EDR's response (received February 4, 2005), fire insurance map coverage was not available.
- A review of aerial photographs for the Property and surrounding area, dated 1953, 1963, 1974, 1990, 1994, and 2002, (as shown in Appendix B.1) provided by EDR.
- A review of available historical topographic maps for the Property and vicinity, dated 1930, 1967 (photorevised 1975), and 1996, (as shown in Appendix B.2) provided by EDR.
- A review of city directory abstract information, for select years between 1970 and 2004,
 (as shown in Appendix B.3) provided by EDR.

- A review of information pertaining to the topography, geology, and hydrogeology of the area, provided in EDR's GeoCheck Physical Setting Source Addendum.
- A review of readily available records for the adjacent landfill facility from the San Diego
 Department of Environmental Health (SDCDEH) on April 5, 2005.
- A request for records available for the Otay Landfill from landfill division of the County of San Diego.
- A review of the United States Geological Survey (USGS) Imperial Beach, California 7.5 min quadrangle index.
- A review of the search of environmental regulatory agency data base records conducted by EDR, dated February 4, 2005, for the Property and off-site addresses in the vicinity of the Property. A copy of the EDR report is included as Appendix C. EDR conducted searches of federal data bases including: National Priorities List (NPL); Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS); Emergency Response Notification System (ERNS); Corrective Action Report (CORRACTS); and Resource Conservation and Recovery Information System (RCRIS). State data bases included: Active Annual Workplan Sites; Cal Sites data base; California Hazardous Materials Incident Report System (CHMIRS); Cortese; and Leaking Underground Storage Tank (LUST) Information System; Solid Waste Information System; Proposition 65; Toxic Pits; Underground Storage Tank (UST) data base; and Facility Inventory data base (FINDS).

Because the environmental data bases themselves are sometimes not updated by the specific regulatory agencies for a period of up to one year or more (depending on the data base and the agency), the data base search conducted herein will not necessarily list any Property recently identified as having, or which are suspected of having, environmental problems and/or for which an environmental investigation/ listing has been initiated, or reflect the current status of activities at a particular Property, subsequent to the last update of a given list. The dates of the most recent updates for the aforementioned environmental data bases are listed in the data base report in Appendix C.

2.3 Significant Assumptions

The findings presented in this report represent ENVIRON's professional judgment based on the information available to us during the course of this assignment and are true and correct to the best of ENVIRON's knowledge as of the date of the review. ENVIRON made reasonable efforts to verify the written and oral information provided in this review. Nevertheless, this report is accurate and complete only to the extent that information provided to ENVIRON was itself accurate and complete. However, ENVIRON has found no reason to question the information received.

ENVIRON's work was performed in accordance with generally accepted engineering standards. It is ENVIRON's specific intent that the conclusions and recommendations presented herein be used as guidance and not necessarily as a firm course of action unless explicitly stated as such.

2.4 Exceptions to/Deletions from ASTM Practice E1527-00

ENVIRON made no exceptions to, or deletions from, ASTM Practice E1527-00 during this assessment, except as follows:

- Resumes from personnel conducting the assessment are not included in the report, but will be provided upon request.
- Due to the size of the Property, access limitations, weather conditions at the time of the site visit, and other safety concerns, ENVIRON did not walk the entire area of Property.
- Because the Property does not have a legal address, building department records were not searchable.

2.5 Special Terms and Conditions

This ESA was conducted in accordance with ASTM Practice E1527-00, as agreed upon by ENVIRON, and The City of Chula Vista in January 2005.

2.6 User Reliance

This ESA report has been prepared exclusively for use by The City of Chula Vista and may not be relied upon by any other person or entity without ENVIRON's express written permission.

3.0 PROPERTY DESCRIPTION

3.1 Location and Legal Description

The Property consists of two, undeveloped parcels of land, herein referred to as Parcel A and Parcel B. The location of the Property (Township 18 South, Range 1 West, Section 18 and 17) is shown on the United States Geological Survey (USGS) topographic map for the Imperial Beach, California quadrangle, as depicted in Figure 1. Parcel A consists of approximately 50 acres and is situated on portions of two parcels, parcel 644-011-06 on the western half and parcel 644-011-11 on the eastern half. Parcel B is consists of an approximately 80-acre portion of a larger, 212-acre parcel (Assessor's Parcel Number: 644-020-07); however Parcel B not a legal parcel in and of itself.

3.2 Property and Vicinity General Characteristics

Parcel A currently is owned by Sunbow and is located in a predominantly residential area of the City of Chula Vista. Parcel A consists of an irregularly shaped parcel of undeveloped land that abuts the northern boundary of the Otay Landfill and Parcel B. It is bounded to the north by an open space preserve, which runs along the southern side of Olympic Parkway. Across from Olympic Parkway is a single-family residential community. Undeveloped land borders Parcel A to the east and west.

Parcel B is currently owned by San Diego Landfill Systems and consists of an approximately 80-acre rectangular parcel of land, located on the western section of the Otay Landfill area. It is bounded to the north by Parcel A and undeveloped land, the Otay Landfill to the east, a residential community to the west, and undeveloped land to the south. According to Mr. Holty of Ayres, an approximate five-acre parcel of land, located at the northwest corner of Parcel B (Assessor's Parcel Number: 644-020-08), is owned by the Otay Water District and is not considered a part of the Property.

Parcels A and B lie at an elevation ranging from approximately 300 to 435 feet above mean sea level (USGS; Imperial Beach, California 7.5 min quadrangle index). General topography at the Property is moderately hilly and slopes downward to the south.

In the evaluation of the potential for environmental problems from other sources to impact the Property, one must consider the possibility that ground water could transport contamination from sites in the vicinity to the Property. Therefore, the depth and flow direction of ground water are important. In order to evaluate the possibility of migration of contaminants from other sites onto the Property, this section presents a discussion regarding the geological and hydrogeological setting of the Property.

9

Based on the report titled, "Limited Soil-Gas, Soil, and Ground water Sampling Report for Rancho Del Sur Phase II, San Diego, California", dated June 3, 1994, prepared by Geocon, surficial lithology in the vicinity of the Property is classified as being within the Tertiary-aged Otay Formation. The Otay Formation is described as light-gray and light brown, moderately well-sorted, poorly indurated, massive sandstone and claystone. Soil conditions encountered in the vicinity of the Property during Geocon's investigation consisted of the Otay Formation from the ground surface to an approximate depth of 228 feet bgs. The Otay Formation consists primarily of medium dense to dense, silty, fine to medium, and coarse sandstone, with some clay. A stiff to hard bentonite layer was encountered between depths of approximately 90 and 100 feet below ground surface (bgs). The lower portion of the Otay Formation is silty to clayey, fine to course sand with gravel.

The Property is located within the Otay Valley Hydrologic Area, which is designated as having existing beneficial uses of ground water for municipal, agricultural, and industrial purposes. Based on data obtained from EDR's GeoCheck[™] Physical Setting Source Summary, depth to first ground water has been measured between 110 to 180 feet bgs (measured between one-quarter to one-half mile south-southeast of the Property) with an inferred hydrogeologic gradient to the west, towards San Diego Bay. Geocon encountered two water-bearing zones in the vicinity of the Property during its 1994 investigation. Perched, shallow ground water was encountered at approximately 167 feet bgs and a second, unconfined ground water-bearing zone, was encountered at approximately 278 feet bgs.

Based on the EDR GeoCheck® Report, there are no federal public water wells within a ½-mile radius of the Property. In addition, EDR does not report the Property within the 100- or 500-year floodplain.

3.3 Current Use of Property

Parcel A has been undeveloped since as early as 1953 (based on ENVIRON's review of historical aerial photographs). Parcel B is undeveloped and is located within the boundaries of the Otay Landfill; however, it is not permitted for landfilling activities, nor has it historically been used for landfilling activities.

3.4 Description of Structures, Roads, and Other Improvements

The Property consists of two parcels of undeveloped land. The northern parcel (Parcel A) consists of approximately 50 acres, and the southern parcel (Parcel B) consists of approximately 80 acres. Based on ENVIRON's observations of the Property at the time of the site visit and information provided by Mr. Holty, no utilities are or historically have been provided to the Property and no structures currently are present at the Property.

10

3.5 Current Use of Adjoining Properties

The area in the nearby vicinity of the Property consists predominantly of residential developments. The Otay Landfill borders Parcel A to the south and Parcel B consists of the western portion of the Otay Landfill area. The Otay Landfill is a Class III municipal solid waste landfill comprising approximately 464 acres, of which approximately 230 acres are currently permitted for landfilling. The landfill is permitted for disposal of non-hazardous waste, which includes residential and commercial municipal solid waste, inert solid waste, and industrial waste.

4.0 USER PROVIDED INFORMATION

The "users" of the Phase I ESA (i.e., The City of Chula Vista) are tasked with providing certain information as part of the Phase I ESA process that is outside ENVIRON's scope of work, but is included as part of the ASTM standard. Specifically, the users should provide, if available, the following information or documentation:

- Title records for environmental liens or activity and use limitations on the Property.
- Reasonably ascertainable sources of information for evidence of environmental liens or activity and use limitations on the Property.
- Specialized knowledge or experience regarding the Property.
- Owner and occupant information.
- The purpose for performing the Phase I ESA.

A summary of the information relating to these user tasks provided to ENVIRON is provided below.

4.1 Title Records and Environmental Liens

A review of title records and other reasonably ascertainable information to identify environmental liens or activity and use limitations associated with the Property was not included within ENVIRON's scope for this ESA; however, ENVIRON did not identify and was not provided any information that would indicate that there are any environmental liens associated with the Property.

4.2 Specialized Knowledge

With the exception of the presence of the Otay Landfill (and former Class I hazardous waste transfer station and former Class I landfill) located east and south of the Property, no additional specialized knowledge or experience that is material to RECs at the Property was provided to ENVIRON by Ayres or the City of Chula Vista as part of this ESA.

4.3 Owner and Occupant Information

Parcel A currently is owned by Sunbow and is undeveloped and unoccupied. Parcel B is owned by the San Diego Landfill System and is also undeveloped and unoccupied.

4.4 Reason for Performing the Phase I

It is ENVIRON's understanding that The City of Chula Vista are conducting this assessment in connection with the proposed re-zoning and development of the Property for residential use. This ESA is being completed in connection with a Human Health Risk Assessment to evaluate the potential human health risks associated with the former Class I Hazardous Waste transfer station and the presence of the current Otay Landfill. ENVIRON assumes that the ESA is being conducted to identify potential environmental conditions associated with the Property could materially affect the development, pose potential human health risks, or the value of the Property.

13

5.0 RECORDS REVIEW

5.1 Environmental Regulatory Data Base Review

To assess the potential for soil and/or ground water contamination at the Property due to onand off-site sources, ENVIRON conducted a review of a federal and state regulatory agency data base search report prepared by EDR and requested readily available files from local environmental regulatory agency files for the Property.

ENVIRON contracted with EDR to conduct a search of federal and state regulatory agency data bases to identify listings for the Property and nearby sites in the vicinity of the Property. EDR conducted the environmental regulatory agency data base search in accordance with the search radii recommended by the ASTM standard. The EDR report is presented in Appendix C. The Property is not listed on the data bases searched by EDR.

In this section, only facilities that were listed on data bases of environmentally impaired sites, and that are located in the immediate vicinity of the Property or are located upgradient (but are not necessarily located near the Property) are discussed. These facilities were selected based on the assumption that a hazardous material released to the subsurface generally does not migrate laterally within the unsaturated soil for a significant distance, but a hazardous material can migrate in the ground water in a generally downgradient direction. However, there are limitations to this interpretation (e.g., ground water gradient where a steep gradient may allow further downgradient migration, a flat gradient may allow spreading both up and downgradient, type of hazardous material released where miscible material may migrate further, and other geologic and hydrogeologic conditions). Based on the most recent ground water monitoring data (GeoLogic, 2004) for the adjacent land landfill, ground water flow direction is from the east-northeast to west-southwest in the vicinity of the Property.

- The Otay Landfill, located immediately adjacent to Parcel A to the south and containing Parcel B (as its western half) is listed on the following data bases:
 - Solid Waste Facility/Landfill (SWF/LF) The data base listing, as reported by EDR, indicates that wastes accepted at this landfill consist of agricultural, construction/demolition, green materials, mixed, municipal, other designated, sludge (biosolids), and tires. The listing indicated that the owner and operator of this 464-acre solid waste landfill is Allied Waste Industries, Inc. The permitted throughput of this facility is reported as 5,000 tons per day with a total capacity of approximately

59,857,199 cubic yards. No additional pertinent information was available in EDR's data base SWF/LF listing for this facility. A listing on this data base is not, in and of itself, indicative of environmental impact at the site.

- Resource Conservation and Recovery Act Information (RCRAInfo) The landfill is listed on this data base as a small quantity generator (SQG; generating between 100 and 1,000 kilograms of hazardous waste per month) with no reported violations. RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. No additional pertinent information was available in EDR's RCRA-SQG data base listing for the Otay Landfill facility. A listing on the RCRAInfo data base is not, in and of itself, indicative of environmental impact at the site.
- Hazardous Materials Information System (HAZNET) data base The HAZNET data base is extracted from the copies of hazardous waste manifests received each year by the California Department of Toxic Substances Control (DTSC) and is not indicative of environmental impairment at the site. According to the EDR data base report, the HAZNET data base was last updated on December 31, 2002. The Otay Landfill is listed for manifests generated as a result of the off-site disposal of the following categories (and total approximate quantities) of hazardous wastes²:
 - Aqueous solutions (with ten percent or more organic residues) 1.95 tons
 - Waste oil and mixed oil 1.75 tons
 - Unspecified sludge waste 0.3961 tons
 - Household wastes 9.6 tons
 - Off-specification, aged, or surplus organics 0.49 tons
 - Liquids with a pH less than 2 amount not listed
 - Unspecified oil-containing waste 0.6255 tons
 - Other organic solids 0.10 tons
- San Diego County Hazardous Materials Management Division (HMMD) data base
 The landfill is listed for its registration as a permitted landfill with the County of San

15

ENVIRON

² Specific dates of generation are not included in the HAZNET data base listing information.

Diego. The listing includes such information as emergency and owner and operator contact information and is not an indication of environmental impact at the site.

- APTEC (also listed at 1700 Maxwell Road) is listed on the following data bases:
 - RCRA This facility is listed as a large quantity generator (LQG; generating over 1,000 kilograms of hazardous waste, or over one kilogram of acutely hazardous waste per month). This facility was formerly a Class I hazardous waste transfer station, located within the boundaries of the Otay Landfill (located south of Parcel A and east of Parcel B). The RCRA-LQG data base was last updated in November of 2004.
 - Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) - The CERCLIS data base contains data on potentially hazardous waste sites that have been reported to the United States Environmental Protection Agency (USEPA) by states, municipalities, private companies, and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The CERCLIS data base contains sites, which are either proposed to or on the National Priorities List (NPL) and sites that are in the screening and assessment phase for possible inclusion on the NPL. The CERCLIS data base was last updated in August of 2004. Based on the EDR data base report listing, APTEC is listed on the CERCLIS data base as having been initiated to the screening and assessment phase (i.e., "discovery phase") in August of 1980, with a Preliminary Assessment conducted in November of 1987. The data base listing indicates that a RCRA Facility Assessment and Site Inspection were conducted in September of 1989. Finally, based on this EDR listing, the case was subsequently archived in January of 1996 and put on the "No Further Remedial Action Planned" (NFRAP) list. Because this facility was a temporary storage facility and was granted a NFRAP status by the DTSC, it is unlikely that former operations at the APTEC site have adversely impacted the Property.
 - RCRAInfo This facility is listed as a waste Transfer, Storage, or Disposal Facility (TSDF). This data base includes selective information on sites, which generate, transport, store, treat and/or dispose of hazardous waste as defined by RCRA. Transporters are individuals or entities that move hazardous waste from the generator to an off-site facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste. The listing includes such information as owner contact

information and EPA identification number (CAT080010101) and is not indicative of environmental impact at the site. The RCRAInfo-TSDF data base was last updated in November of 2004.

- Corrective Action Report (CORRACTS) The CORRACTS data base identifies hazardous waste handlers with RCRA corrective action activity and was last updated in September of 2004. Thirty-six violations for this facility are listed in the EDR data base report dated August of 1988 through December of 1995. According to the listing all of the violations achieved compliance before the facility was closed and that APTEC was issued a monetary penalty of \$10,000 in April of 1994. No additional pertinent information was available in EDR's data base listing regarding this facility.
- REF This data base contains sites where contamination has not been confirmed and which were determined as not requiring direct DTSC Site Mitigation Program action or oversight. Accordingly, these sites have been referred to another state or local regulatory agency. According to the EDR data base listing, the lead agency for APTEC was turned over from the DTSC to the EPA in 1983 as part of the CERCLA screening and assessment activities conducted in 1996, as discussed above. According to the REF data base listing, APTEC was a transfer station for non-hazardous and hazardous liquid sludge and slurry wastes in bulk and hazardous liquid/solid wastes in drums or other approved containers. Waste specifically not accepted at the APTEC facility included PCBs, explosives, and radioactive materials. The listing also indicates that the APTEC facility was completely surrounded by the Otay Landfill and classified as a hazardous storage and transfer facility zoned for "open space" and park development. Most significantly, the EDR data base listing indicates that there was "no disposal on-site" and that the APTEC facility was solely a temporary storage facility. According to site inspection notes (contained in the data base listing), the facility was "well-run," with "good storage" and housekeeping practices, good security, and "no identified problems." Lastly, no significant objections were noted during public hearing activities during the final DTSC "No Further Action" ruling in 1996 for the APTEC facility. Because this facility was a temporary storage facility and was granted a NFRAP status by the DTSC, it is unlikely that former operations at the APTEC site have adversely impacted the Property.

In conclusion, because this facility was a temporary storage facility and was granted a NFRAP status by the DTSC, it is unlikely that former operations at the APTEC site have adversely impacted the Property.

The EDR report indicates that poor or inadequate address information was identified for several sites located in the vicinity of the Property; therefore, these sites could not be mapped by EDR. Because the location of these sites with respect to the Property could not be evaluated, ENVIRON is limited in its ability to express an opinion regarding the potential for impact to the Property from these sites. Nevertheless, ENVIRON reviewed the list of unmappable sites and did not identify listings for any sites located adjacent to the Property.

5.2 Historical Use Information on the Property and Surrounding Area

To evaluate the historical uses of the Property, ENVIRON interviewed Mr. Samuel Holty, Vice President of Ayres, reviewed selected documents for the Property provided by Ayres, reviewed historical aerial photographs, historical topographic maps, and information obtained from city directory abstracts. The results of ENVIRON's historical review are presented below.

5.2.1 Historical Operations Interview

ENVIRON interviewed Mr. Samuel Holty regarding the historical uses of the Property. Mr. Holty has been familiar with Parcel A since it was purchased from RDR, LP (a partnership representing the Kruer Family) by Ayres in 1996 and familiar with Parcel B since approximately 2000. According to Mr. Holty, Parcel B has been owned by the San Diego Landfill System (d.b.a. Allied Waste, Inc.) or other entities directly associated with the landfill as far back as he could recall, and was unaware of previous ownership. Mr. Holty reported that to the best of his knowledge, there have been no utilities or structures present at either parcel and that no known chemicals and/or wastes have historically or are presently stored, treated, processed, handled, used, or generated at either parcel of the Property and that both parcels consist of unimproved land. According to information provided by Mr. Holty, there are no environmental liens encumbering the Property. With the exception of the current re-zoning application that has been submitted to the City of Chula Vista, no other environmental litigation or administration proceedings are currently ongoing or pending pertaining to the Property.

In addition, ENVIRON conducted a telephone interview with Mr. Jim Ambroso and Mr. Paul Lozano of Allied Waste, Inc. (owner and operator of the Otay Landfill) on April 6, 2005. Mr. Ambroso has been familiar with the landfill site since 1997 and Mr. Lozano had been familiar with the landfill since 1972. According to Messrs. Ambroso and Lozano, Parcels A and B have been undeveloped for as long as they have been familiar with the landfill and

18

surrounding areas. According to Mr. Lozano, portions of Parcel B were used as backfill during closure operations for the former Class I landfill located at the landfill area east of Parcel B. Mr. Lozano reported that to the best of his knowledge, no other activities or operations currently of historically have been conducted on Parcel B.

5.2.2 Aerial Photographs

Historical aerial photographs of the Property and surrounding area dated 1953, 1963, 1974, 1990, 1994, and 2002, were provided by EDR. A summary of ENVIRON's observations regarding the historical aerial photographs is presented below.

The aerial photograph dated 1953 depicts the Property as predominantly undeveloped, with the exception of several unimproved dirt paths and/or roads traversing Parcel B. Centrally located on Parcel B, is a small collection of surface features (possibly indicative of a single-family residential dwelling). However, due to the poor quality of the photographic reproduction, additional details regarding these features are not clearly discernable. In addition, an irregularly shaped area of disturbed land is depicted near the eastern boundary of Parcel B. Based on the shadows cast at the time this photograph was taken, it appears that these areas are depressions in the natural topography, where the natural vegetation also has been removed. Based on the knowledge that Parcel B is part of the Otay Landfill, it is possible that these disturbed areas are evidence of activities pertaining to or related to the adjacent landfilling operations (i.e., potentially excavated for soil to be used as ground cover). Again, due to the poor quality of the photographic reproduction, the specific nature of land use in this area of Parcel B cannot be positively identified.

With the exception of surface features (possibly indicative of grading and/or clearing activities) visible to the east of the Parcel B, both parcels are surrounded by vacant land. An industrial facility is visible approximately 500 feet to the south of the southern border of Parcel B. The area of the Property is depicted as a hilly. With the exception of the aforementioned disturbed areas and unimproved paths/road depicted at Parcel B, the remainder of the Property is covered with low-lying vegetation and trees.

 The aerial photograph dated 1963 depicts the Property as predominantly undeveloped, again with the exception of several unimproved dirt paths and/or roads traversing
 Parcel B. A small portion of land, close to or at the eastern boundary of Parcel B is

19

depicted with a series of dark-colored, rectangular shapes (immediately north of the disturbed areas previously identified on the 1953 aerial photograph). These features possibly are indicative of agricultural land use; however, based on the nature of activities (i.e., landfilling) in the adjacent areas, is more likely that these areas have been designated or partitioned (possibly related to the adjacent landfilling operations). Again, due to the poor quality of this photographic reproduction, the specific nature of land use in this area cannot be positively identified.

The small collection of surface features observed on the previous photograph is not visible on the 1963 photograph; however, several smaller features are visible in the general area (not necessarily indicative of structures). Again, due to the poor quality of this photographic reproduction, the specific nature of land use in this area cannot be positively identified.

The disturbed areas identified near the eastern border of Parcel B on the 1953 aerial photograph are visible on the 1963 aerial photograph; however, they appear to have changed in slightly in shape and color. The area still appears to be a depression in the natural topography of the Property, and may be related to the adjacent landfilling operations.

The industrial facility identified 500 feet south of the southern border of Parcel B is visible on the 1963 aerial photograph. It appears to have expanded and included surface features characteristic of setting, percolation, evaporation, and/or aeration ponds for industrial use. Based upon supporting information available in the EDR data base report, this facility is the Omar Rendering Disposal Site. This facility is located topographically and hydrogeologically downgradient from the Property. However the Omar Rendering Disposal Site consists of approximately 40 acres of a former hazardous waste disposal facility that operated from 1959 through 1978 and utilized evaporations ponds for disposal. These ponds were excavated upon closure of the site and the residues were placed in a containment cell at the northwest of the site. Based on information provided by representatives of the City of Chula Vista, the containment cell is monitored by the RWQCB. Based on the fact that this former facility is located topographically and hydrogeologically downgradient from the Property, adverse environmental impact to the Property as a result of former operations at this facility is considered to be low.

The aerial photograph dated 1974 depicts the Property as predominantly undeveloped. The number of unimproved paths/roads traversing Parcel B appears to have increased since the previous aerial photograph dated 1963. In the area of the previously observed, centrally located collection of surface features, two surface features are depicted (possibly structures), with paths/roads leading to it from the main access roads depicted in the area.

The disturbed areas identified near the eastern border of Parcel B on the previous aerial photographs are visible on the 1974 aerial photograph; however, they appear to have changed again in shape and color. The area still appears to be a slight depression in the natural topography of the Property.

Two dark colored, rectangular shaped surface features are visible approximately 1,200 feet east of Parcel B and approximately 600 feet south of Parcel A, that are characteristic of liquid settling ponds. The cleared area of the landfill operations to the east and south of the Property appears to have been expanded since the previous aerial photographs.

• The aerial photograph dated 1990 depicts the Property as predominantly undeveloped. A residential development is observed immediately adjacent to the western boundary of Parcel B. Evidence of the Omar Rendering Disposal Site is not visible on the 1990 aerial photograph. The site of the former disposal facility is depicted as undeveloped with a single, paved access road. Adjacent to the former Omar Rendering Disposal Site and south of Parcel B, is an industrial park and the present-day San Diego Department of Public Works campus.

In the central area, the two surface features observed on the previous aerial photograph are not visible on the 1990 aerial photograph.

The disturbed areas identified near the eastern border of Parcel B on the previous aerial photographs are visible on the 1990 aerial photograph; however, they appear to have changed slightly in shape and color. This area still appears to consist of a slight depression in the natural topography of the Property.

The two dark colored, rectangular shaped surface features (characteristic of settling ponds, depicted on the adjacent landfill area) are not visible on the 1990 aerial

photograph. These former features appear to have been backfilled or covered and are covered with sparse, low-lying vegetation.

Visible approximately 500 feet east of Parcel B and approximately 1,000 feet south of Parcel A is a small industrial facility, primarily consisting of several small buildings and a large exterior storage yard. The storage yard appears to be occupied with various sized containers. Based on ENVIRON's review of the EDR data base report, this facility is most likely the APTEC facility (a former non-hazardous and hazardous transfer station). This facility appears to consist of between eight and ten acres of land.

The industrial development to the south of Parcel B appears to have increased since the previous aerial photographs.

The aerial photograph dated 1994 depicts the Property as undeveloped. The disturbed areas identified near the eastern border of Parcel B on the previous aerial photographs are visible on the 1994 aerial photograph; however, they appear to have changed slightly in shape and color. This area still appears to consist of a slight depression in the natural topography of the Property. A tall, skinny surface feature (as evident by shadows) is present near the north end of this disturbed area. This surface feature could possibly be a storage vessel or structure; however, due to the poor quality of this photographic reproduction, the identity of this feature cannot be confirmed.

The APTEC facility is visible on the 1994 aerial photograph.

• The aerial photograph dated 2002 depicts the Property as undeveloped. The disturbed areas identified near the eastern border of Parcel B on the previous aerial photographs are visible on the 2002 aerial photograph; however, they appear to have changed again in shape and color. The tall, skinny surface feature observed on the previous aerial photograph is not visible on the 2002 aerial photograph. The area of the APTEC facility is visible on the 2002 aerial photograph; however, land use at the facility appears to have changed since the previous aerial photograph. The storage yard appears to have been replaced by scattered trees, several unimproved access roads, and various surface features that due to the poor quality of the photographic reproduction, the identity of which cannot be confirmed.

5.2.3 Building Department Records

Because the Property does not have a legal address, building department permits could not be searched.

5.2.4 City Directory Abstracts

Because Parcel A of the Property does not have a legal address, ENVIRON used the address of the Otay Landfill and former APTEC facility (1700 Maxwell Road) for EDR's city directory abstract search. No addresses are listed on Maxwell Road from 1970 through 1995. The 1700 Maxwell Road address first appears in the 1995 Haines Criss-Cross Directory as Otay Landfill and again in 2000 and 2004, along with American Transit Corp (at 1800 Maxwell Road). No other neighboring addresses were listed in the city directory abstract information provided by EDR.

5.2.5 Historical Topographic Maps

ENVIRON reviewed historical topographic maps obtained for the Property and vicinity from EDR, dated 1930, 1967 (photorevised 1975), and 1996. All four maps depict the Property and immediately surrounding areas as undeveloped. With the exception of the unimproved roads, no additional details regarding land use or specific surface features are depicted. The evaporations ponds of the former Omar Rendering Disposal Site are depicted on the 1967 and 1975 maps. The Otay Landfill is depicted on the 1975 and 1996 map. The residential development abutting the western boundary of Parcel B is depicted on the 1996 map. No additional information pertaining to potential on or off-site contamination sources were depicted on the historical topographic maps.

5.2.6 Sanborn Fire Insurance Maps

Historical fire insurance maps covering the Property and vicinity were requested but, according to EDR's response (received February 4, 2005), fire insurance map coverage was not available for the Property and vicinity.

5.2.7 Summary of Previous Reports

ENVIRON reviewed the report titled, *Limited Soil-Gas*, *Soil*, and *Groundwater Sampling Report*, prepared by Geocon on June 3, 1994. The scope of Geocon's work involved four tasks, limited vadose moisture monitoring, limited soil gas monitoring, temporary monitoring well installation, and limited ground water sampling of a site located adjacent to the north of the Otay Landfill. Results of vadose zone monitoring did not encounter water in any

of the wells sampled. Detectable concentrations (>1,000 parts per million [ppm]) of methane were identified in Well G6-G (located at the northern boundary of the landfill area) at 35 feet bgs. Maximum concentrations of methane were detected in soil gas samples as high as 3,300 ppm. Analytical results for soil samples collected from two exploratory borings located exhibited lead and copper concentrations as high as 29.1 milligrams per kilogram (mg/kg) and 28.4 mg/kg respectively. Concentrations of halogenated VOCs greater than laboratory detection limits were not exhibited.

Analytical results indicate concentrations of VOC below laboratory detection levels in ground water sampler collected from wells located along the northern boundary of the landfill area. In additions, no concentrations of Title 22 metals were detected in ground water samples above the Maximum Contaminant Levels (MCLs) for the State of California primary drinking water standards.

5.2.8 Historical Summary

Based on ENVIRON's review of the historical information sources described above, the Property has been predominantly undeveloped since as early as 1953 (based on ENVIRON's review of historical aerial photographs).

5.3 Local Agency Record Review

ENVIRON submitted a request to review all readily available public records pertaining to the current Otay Landfill and former Class I hazardous waste transfer facility located at the Property from the San Diego HMMD on February 3, 2005. Subsequently, ENVIRON reviewed the requested documents at the HMMD on April 5, 2005. The following is a summary of ENVIRON's HMMD file review.

ENVIRON reviewed readily available records for the site located at 1700 Maxwell Road, Chula Vista, California dated February 1994 to February 2004. The records consisted of the following documents:

- Compliance Inspection Reports
- Unified Program Facility Reports
- San Diego Regional Hazardous Materials Questionnaires
- Hazardous Materials Business Plans (HMBP)
- Health Permit Applications, a Monitoring Well and Boring Construction and Destruction
 Permits
- Maintenance of Monitoring Well Certifications

According to information contained in the reviewed records, the Otay Landfill operates a 1,500-gallon diesel fuel aboveground storage tank (AST; installed in 1999) and a 250-gallon propane AST to fuel on-site vehicles (based on a Compliance Inspection Report dated March 4, 2004). No violations were noted regarding the operation of this AST. In addition, according to the most recent Unified Program Facility Report contained in the files (dated November 3, 2003), the Otay Landfill listed acetylene, diesel fuel, ethylene glycol (anti-freeze), compressed oxygen gas, and Stoddard Solvent used in its operations. Hazardous wastes generated at the facility include waste oil and mixed oil, waste organic liquids, waste laboratory chemicals, and used oil filters. According to the Unified Program Facility Report, these wastes are transported off-site by Asbury Environmental Services to an approved disposal, transfer, or recycling facility. No significant environmental concerns were identified by the HMMD between 1994 and 2004 regarding Otay Landfill's hazardous waste disposal practices.

According to a San Diego Regional Hazardous Materials Questionnaire completed by San Diego Landfill Systems (dated February 12, 2001), a permitted methane gas flare station is operated at the Otay Landfill.

Based on ENVIRON's review of the aforementioned records, no obvious evidence of activities and/or practices conducted at the Otay Landfill that pose an environmental threat relative to the Property (specifically related to RECs or suspect RECs) were noted. With the exception of several administrative violations, no other significant environmental concerns were identified pertaining to the Otay Landfill between 1994 and 2004.

The records obtained from the HMMD indicates that various ground water monitoring wells are located throughout and downgradient of the landfill. Based on a Monitoring Well and Boring Construction and Destruction Permit (dated February 3, 1999), six borings were permitted at the landfill by Burns & McDonnell Waste Consultants, Inc. and Tri-County Drilling, Inc. in order to evaluate the presence of perched ground water and the lateral extent and physical properties of the perched zone. An additional four ground water monitoring wells were permitted for installation in September of 1998 by Golder Associates and Layne Christensen Company in order to provide ground water flow direction data for the intermediate aquifer and facilitate future water quality monitoring.

In addition, ENVIRON conducted a review of available documentation pertaining to the Otay Landfill that is maintained by the San Diego County Department of Environmental Health, including the following documents:

• Final Closure and Postclosure Maintenance Plan, Otay Class I Landfill, prepared by URS Greiner Woodward Clyde (the "URS Report"), dated March 24, 2000.

25

ENVIRON

Water Quality Monitoring Report, Semiannual (April 2004 through September 2004)
 Report, Otay Landfill, prepared by GeoLogics Associates (the GeoLogics Report), dated
 October 2004.

According to the URS Report, a Class I Landfill formerly was operated in the vicinity of the Property (approximately 800 feet of the eastern boundary of Parcel B and approximately 500 feet from the south of Parcel A) beginning in 1963. The Otay Class III Landfill surrounds the former Class I Landfill. The Class I portion of the landfill occupied approximately 21 acres on the 47-acre County landfill site. According to the URS report, approximately 17 million gallons of liquid hazardous wastes were disposed of in this unlined landfill from 1963 through October 1980. Wastes accepted at this Class I landfill included, but was not limited to, oil and oil/water mixtures; paint and paint sludges; chemical fertilizers; chemical toilet wastes; drilling muds; brines; corrosive pickling liquors; corrosive acids and alkalines; plating wastes; acid wastes; and acid enchants. Based on historic information, approximately 100,000 cubic yards of hazardous solid waste was also disposed at this facility, including, but not limited to, asbestos, oil spill booms, debris, was, and paint.

In November of 1980, the County Board of Supervisors directed that the disposal of hazardous wastes be discontinued at the Otay Class I Landfill. Subsequently, a portion of the Otay Landfill site was leased for the establishment of a privately operated industrial waste transfer station (APTEC, discussed in Section 5.1) to provide an alternate service for local generators of hazardous waste material. The transfer station was closed in 1997.

In October 1997 the RWQCB issued Addendum No. 1 for Order 77-44 to separate the inactive Class I Landfill from active Class III facility. This addendum was a result of the ownership, transfer of Otay Class III Landfill from the County of San Diego to a private entity. Concurrently, the site was de-annexed from the City of Chula Vista in 1997. The County of San Diego presently owns the Class I Landfill. The facility has been inactive since 1980 and the County does not intend to operate it in the future. The neighboring Class III portion of the Otay Landfill currently is owned and operated by San Diego Landfill Systems, a division of Allied Waste Industries.

There is a network of 18 landfill gas (LFG) monitoring probes located around the Otay Landfill (Class I and III) boundary to monitor for LFG that may be migrating off the landfill area. In addition to the current LFG probes, ground water monitoring wells have also been installed, located along the periphery of the landfill area, including three near the southwestern boundary of the Class I waste disposal area (near the eastern boundary of Parcel B).

Based on the most recent groundwater sampling data (contained in the GeoLogic Report) provided by the San Diego County Department of Environmental Health (SDCDEH), no volatile organic compounds (VOCs) were detected in concentrations higher than laboratory detection levels

in the three wells located near the eastern boundary of Parcel B (downgradient of the former Class I landfill). Assuming that these recent data are indicative of future trends, there is no evidence (contained in the documents made available to ENVIRON during this assessment) to indicate that former Class I landfill operations will impact ground water underlying the Property at Parcel B.³

Reportedly, when the Class I landfill was closed in 1980, a closure plan was prepared and approved by the appropriate regulatory agencies. As part of the post-closure, ground water monitoring wells are sampled on a regular basis. Ground water monitoring wells are used to establish ground water quality and the ground water flow direction in proximity to both the Class III and former Class I landfills.

According to information provided in the most recent groundwater monitoring report (GeoLogics, 2004) the ground water flow direction in proximity to the former Class I landfill is toward the west-southwest. Based on this ground water flow direction, monitoring wells OTGW-24, OTGW-25, and OTGW-17 are located generally downgradient of the landfill and upgradient of Parcel B. Based on the most recent ground water sampling data, volatile organic compounds (VOCs) were not detected in ground water in these wells. Assuming that these recent data are indicative of future trends, VOCs have not and likely will not impact ground water underlying Parcel B. Because no VOCs were detected above laboratory detection levels in wells adjacent to Parcel B (downgradient from the former Class I landfill), the potential for off-gassing of VOCs from the ground water to underlying soil gas is considered to be low. Therefore, ENVIRON has no further recommendations for further evaluation of VOCs in ground water underlying or in proximity to the Property.

Based on ENVIRON's experience with landfilling activities, the potential for migration of methane gas to the Property (generated as a result of decomposition of buried wastes at the landfill) cannot be ruled out and will be addressed in more detail in ENVIRON's health risk assessment being prepared in conjunction with this Phase I ESA.

27 ENVIRON

³ Since the former Class I landfill is located down- or cross-gradient from Parcel A, potential environmental issues as a result of former Class I landfilling operations are unlikely.

6.0 PROPERTY RECONNAISSANCE

6.1 Methodology and Limiting Conditions

Kristin Thomas of ENVIRON conducted a visit to the Property on February 10, 2005. During the site visit, observations of the Property (as observed primarily from public thoroughfares) were made to evaluate if any RECs, as defined in Chapter 2, were present. Due to the size of the Property, access limitations, weather conditions at the time of the site visit, and other safety concerns, ENVIRON did not walk the entire area of Property.

6.2 General Property Setting and Observations

The presence or absence of environmental areas of interest or potential areas of environmental concern is summarized in Table 1 Only those areas of environmental interest or concern that were observed to be present at the Property are discussed further below.

TABLE 1 Summary of Property Reconnaiss	ance Observations	
Issue	ASTM Section	Observation
Interior and Exterior Issues		
Storage tanks Underground Storage Tanks (fill ports, vent pipes) Aboveground Storage Tanks	8.4.2.4 Absent	
Odors (strong, pungent or noxious)	8.4.2.5	Absent
Asbestos		Absent
Pools of liquid, standing surface water or sumps	8.4.2.6	Absent
Drums of hazardous substances or petroleum products (five- gallon, 55-gallon or totes)	8.4.2.7	Absent
Unidentified containers suspected of containing hazardous substances or petroleum products	8.4.2.9	Absent
Polychlorinated biphenyls in electrical or hydraulic equipment (excluding light ballasts)	8.4.2.10	Absent
Interior Issues		
Heating/cooling systems	8.4.3.1	Absent
Stains or corrosion on interior floors, walls or ceilings (except for staining from water)	8.4.3.2	Absent
Floor drains and/or interior sumps or clarifiers	8.4.3.3	Absent
Exterior Issues		
Pits, ponds or lagoons on Property or adjacent Sites	8.4.4.1	Historically Present
Stained soil or pavement	8.4.4.2	Absent
Stressed vegetation	8.4.4.3	Absent

TABLE 1 Summary of Property Reconnaise	sance Observations	
Issue	ASTM Section	Observation
On-Property solid waste disposal; areas apparently filled or graded by non-natural causes; or mounds or depressions suggesting solid waste disposal	8.4.4.4	Historically Present
Wastewater or other liquid (including storm water) or any discharge into a drain, ditch or stream	8.4.4.5	Absent
Wells (including dry wells, irrigation wells, injection wells, abandoned wells, or other wells)	8.4,4.6	Absent
Septic systems or cesspools	8.4.4.7	Absent

6.2.1 Pits, Ponds or Lagoons on Property or Adjacent Sites

Based on ENVIRON's review of historical aerial photographs, a settling pond associated with the former Class I landfill was formerly located approximately 600 feet east of Parcel B and 300 feet south of Parcel A. In addition, settling ponds (associated with the former Omar Rendering Disposal Site) historically were present to the south of Parcel B.

As previously discussed, volatile organic compounds (VOCs) were not detected in ground water wells downgradient of the former Class I landfill. Assuming that these recent data are indicative of future trends, VOCs have not and likely will not impact ground water underlying Parcel B. Because no VOCs were detected above laboratory detection levels in wells adjacent to Parcel B (downgradient from the former Class I landfill), the potential for off-gassing of VOCs from the ground water to underlying soil gas is considered to be low.

Based on the fact that the former Omar Rendering Disposal Site is located topographically and hydrogeologically downgradient from the Property, adverse environmental impact to the Property as a result of former operations at this facility is considered to be low.

6.2.2 Areas Filled or Graded by Non-natural Causes

Based on ENVIRON's review of historical aerial photographs and supplemental information provided by Messrs. Ambroso and Lozano, disturbed areas (where vegetation had been cleared) depicted on the aerial photographs were a result of the excavation of soil that was used for backfill material during closure activities at the former Class I landfill, east of Parcel B and south of Parcel A. According to information provided to ENVIRON by the SDCDEH, the County of San Diego presently owns the former Class I Landfill area. As previously discussed, the facility has been inactive since 1980 and the County does not intend to operate it in the future. The neighboring Class III portion of the Otay Landfill is

currently owned and operated by San Diego Landfill Systems, a division of Allied Waste Industries.

7.0 INTERVIEWS

7.1 Interviews with Facility Personnel

On February 28, 2005, ENVIRON conducted a telephone interview with Mr. Samuel Holty, Vice President for Ayres. In addition, ENVIRON conducted a telephone interview with Mr. Jim Ambroso and Paul Lozano of Allied Waste, Inc. on April 6, 2005. As indicated throughout the text of this report, ENVIRON relied significantly on information provided by Messrs. Holty, Ambroso, and Lozano. Most notably, the information provided to ENVIRON included:

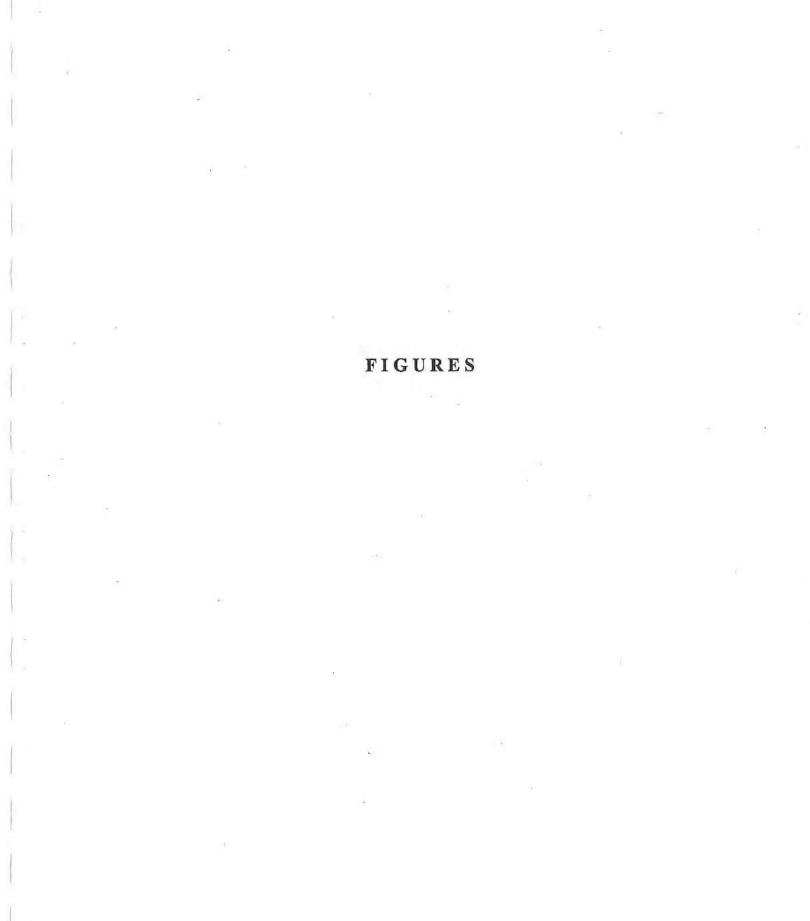

- · An overview of the known history and ownership of the Property, and
- Information regarding the presence or absence of hazardous materials, underground storage tanks (USTs), and/or structures formerly or currently present at the Property.

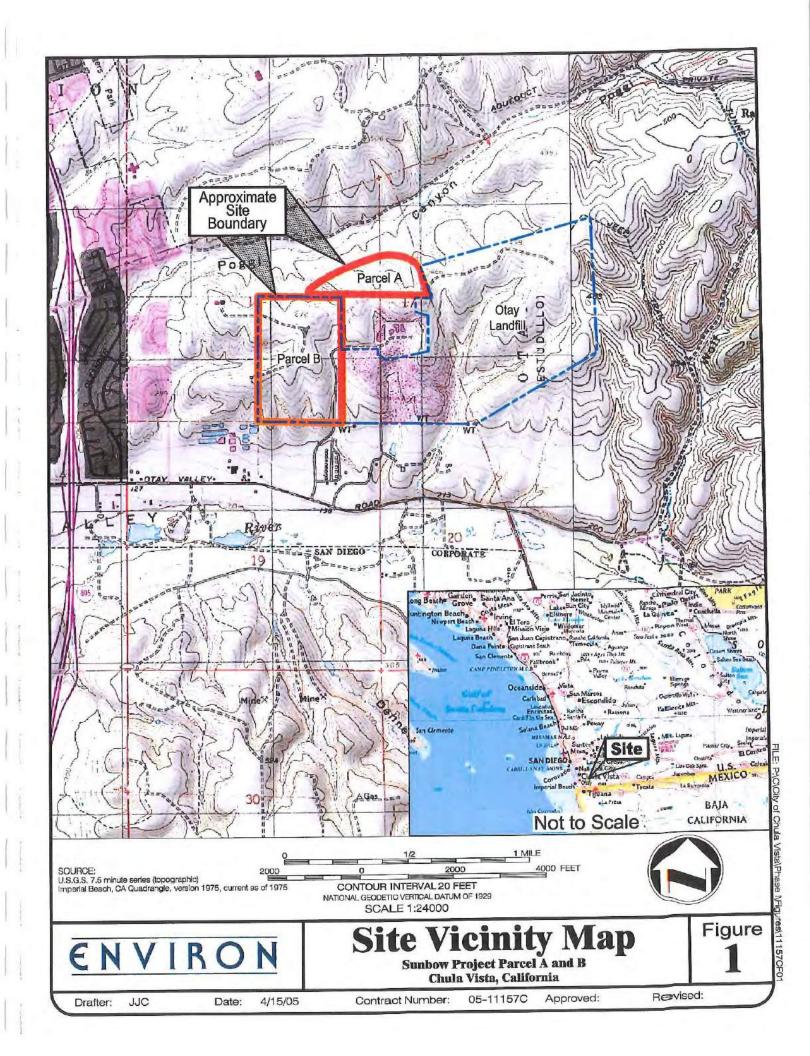

7.2 Interviews with Local Government Officials

ENVIRON requested information pertaining to the Property from local regulatory agencies (e.g., HMMD). In addition, ENVIRON reviewed information from the landfill division of the County of San Diego.

EXECUTIVE SUMMARY

ENVIRON International Corporation (ENVIRON) performed human health risk, nuisance, and odor impact analyses for air emissions from Otay Landfill (the landfill) located at 1700 Maxwell Road, Chula Vista, San Diego County, California. Ayres Land Company, Inc. (Ayres) manages properties for ACI Sunbow, LLC (Sunbow), which owns a 50-acre land parcel adjacent to the north boundary line of the landfill (referred to as "Parcel A" hereinafter). In addition to Parcel A, a second land parcel was included in this evaluation as well, which is located inside the west boundary line of the landfill and is approximately 80 acres (referred to as "Parcel B" hereinafter). ENVIRON was retained by the City of Chula Vista (the City) to evaluate the potential human health risks as well as nuisance issues such as dust deposition and odor, for these two parcels assuming their future potential use as residential, industrial, and/or as a community park.

The air emissions at the landfill include combustion emissions from internal combustion engines (ICEs) and a flare that burns landfill gas, fugitive emissions of landfill gas from the landfill surface, combustion emissions from on-site mobile equipment that burn diesel, combustion emissions from delivery trucks that burn both diesel and gasoline, and fugitive emissions from various landfilling activities such as cover material quarrying, cover material application, dust entrainment from paved and unpaved roads, wind erosion from unpaved areas and disturbed landfill areas, and stockpile handling. The landfill gas (LFG) emissions were estimated using LFG speciation data, default destruction efficiency for the control devices (i.e., the flare and ICEs) and the LFG generation rate. LFG flow rate averaged over the peak 30-year period (2010-2040) was used as the LFG generation rate for estimating the emissions used in the health risk analysis. The emissions of on-site mobile equipment were estimated using the California Air Resources Board (CARB) emission model for off-road equipment (OFFROAD) and the off-road equipment population and activity data provided by Otay Landfill. The emissions of the delivery trucks were estimated using the CARB emission model for on-road vehicles (EMFAC2002) and the activity data provided by the landfill. For the health risk analysis, the emissions between years 2010 to 2040 (to coincide with the peak generation years of LFG) were used to calculate the cancer risks and non-cancer health impacts. The emissions from the fugitive sources were estimated using a combination of the San Diego Air Pollution Control District (SDAPCD) default emission factors and AP-42 equations.

The Hotspots Analysis and Reporting Program (HARP) software was used for the health risk analysis. HARP utilizes the latest Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessment published by the Office of Environmental Health Hazard Assessment

(OEHHA, 2003), the latest toxicity values published by OEHHA, as well as the United States Environmental Protection Agency (USEPA) *Guideline on Air Quality Models* (USEPA, 2003) to calculate the health risks. In order to estimate the exposure levels at the off-site receptors, HARP uses EPA-approved air dispersion model (Industrial Source Complex Short Term – ISCST3) to simulate the air dispersion from the emission sources and to estimate the concentrations at downwind receptor locations. The model uses facility-specific information such as the source locations, source parameters, meteorological data, receptors in the vicinity, and dimensions of the on-site buildings to estimate the ground level concentrations (GLCs) at various receptors. The GLCs are then used by HARP to estimate the health risks. However, HARP does not have the ability to run the ISCST3 model for deposition calculations. Hence, for the nuisance dust analysis, the ISCST3 model was run separately to provide deposition estimates at receptors located in both land parcels.

ENVIRON used hydrogen sulfide and acetaldehyde as surrogate chemicals to evaluate the potential odor impact from LFG emissions and mobile source emissions, respectively. These chemicals were chosen as they have relatively lower odor thresholds as compared to other chemicals emitted from these sources. Since odor impacts are short-term impacts, ENVIRON calculated the 3-minute GLCs for these chemicals using the maximum 1-hour GLCs obtained from the ISCST3 and compared the 3-minute GLCs with the published odor thresholds.

The results of the health risk assessment indicate that the cancer risks for the potential maximally exposed individual resident (PMEIR or MEIR) at both land parcels are less than 10 excess cancer cases in a million, which is the significance threshold typically used by OEHHA for cancer risks (OEHHA, 2003). The significant threshold for non-cancer health effects (chronic and acute) used in this study is 1.0 expressed as hazard index. The chronic hazard and the acute hazard indices are less than 1.0 for the PMEIR at both land parcels. Since the cancer risk and the non-cancer health impacts are less than the significant thresholds for the PMEIR, the health risks for the maximally exposed other types of receptors (for example, worker or visitor) at the two land parcels are also expected to be less than significant due to the fact that the exposure duration for these types of receptors would be shorter than that of a resident. The diesel particulate matter emissions from the on-site mobile sources (i.e., off-road mobile equipment) and the delivery trucks are the highest contributing air toxic to the cancer risks. The on-site mobile sources are the highest contributing sources to the cancer risks at the PMEIR.

The results of the nuisance dust deposition analysis indicate that the deposition levels for the worst-case receptors are greater than the guideline of 67 to 97 g/m²-yr as suggested in peer-reviewed publications. A public response study also reported that deposition rates in the range of 69.6-87.0 g/m²-yr have been perceived as objectionable in industrial settings, which are in general agreement

2

with the suggested guideline levels. ENVIRON estimated that approximately 20% of the area in Parcel B and approximately 5% in Parcel A would experience deposition rates greater than 67 g/m²-yr. These levels could generate complaints from residents of homes in Parcels A and B. In addition, dust fallout and deposition on certain individual days resulting from unpredictable wind gusts could generate complaints from the potential residents in much larger areas.

The results of the odor analysis indicate that the H_2S emitted from the landfill operations produces concentrations that are higher than the geometric mean of the odor threshold for one or more receptors in Parcels A and B during approximately 1.2 percent of the time over a one-year period. The odor impacts of acetaldehyde for the worst-case receptors in Parcels A and B are less than the published odor threshold. It should be noted that there may be other odor-causing compounds in the LFG, which have lower odor thresholds but for which no analytical data were provided.

LFG monitoring data reviewed by ENVIRON show that there are no current data indicating that LFG migration is taking place onto Parcels A and B. However, the probe coverage is rather sparse, especially for Parcel B. Based on ENVIRON's experience with landfills at other locations, the potential for migration of LFG generated as a result of decomposition of buried wastes at Otay Landfill to Parcels A and B, cannot be ruled out. To ascertain the presence of LFG at Parcels A and B, a soil gas survey would need to be performed at these two parcels with emphasis on the areas along the common boundaries of these parcels with the landfill. As long as LFG is generated in the landfill, there is the potential for the migration of LFG to the surrounding areas.

3

1.0 INTRODUCTION

Otay Landfill (hereinafter also referred to as the landfill) is an active Class III municipal solid waste disposal facility located at 1700 Maxwell Road, Chula Vista, San Diego County, California (see Figure 1). The entire landfill property is approximately 464 acres, of which approximately 230 acres are currently permitted for refuse placement. The landfill has been receiving waste since 1963, and is expected to reach its capacity in 2020.

Ayres Land Company, Inc. (Ayres) manages properties for ACI Sunbow, LLC (Sunbow), which owns a 50-acre land parcel adjacent to the north boundary line of the landfill (see Parcel A, as depicted on Figure 2, which will be referred to as "Parcel A" hereinafter). In addition to Parcel A, a second land parcel was included in this evaluation as well, which is located inside the west boundary line of the landfill and is approximately 80 acres (see Parcel B as depicted on Figure 2, which will be referred to as "Parcel B" hereinafter). ENVIRON was retained by the City of Chula Vista (the City) to evaluate the potential human health risks, as well as nuisance issues such as dust deposition and odor, for these two parcels assuming their future potential use as residential, industrial, and/or as a community park. A qualitative evaluation of the potential for landfill gas migration to the two land parcels is also included in this report.

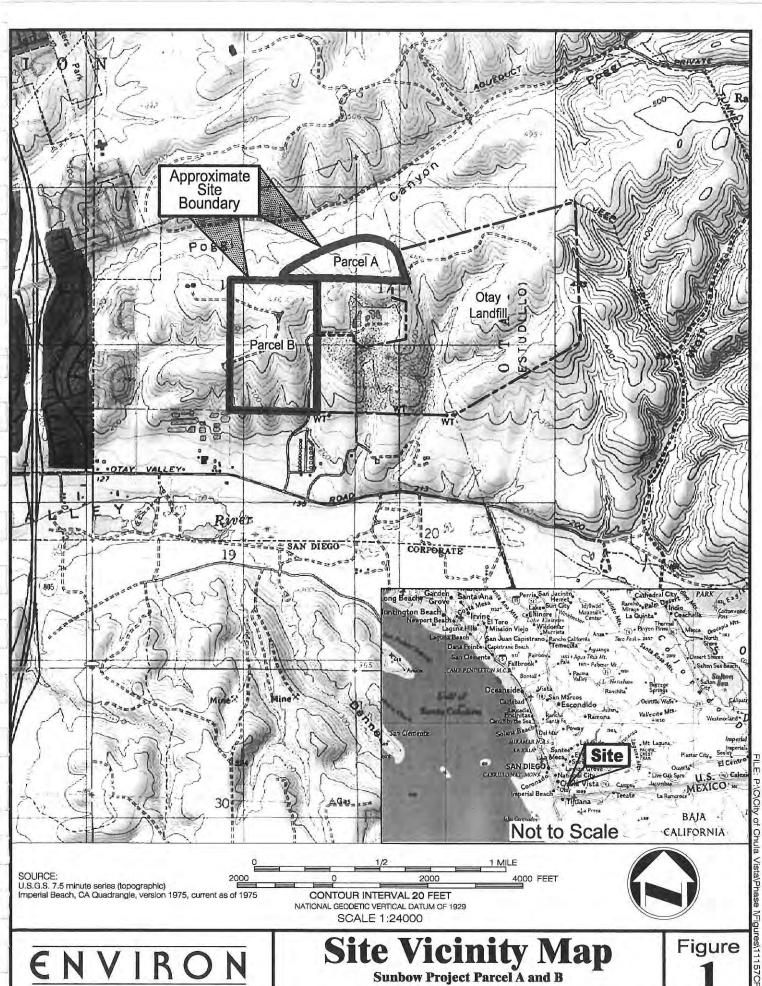

This report is organized as follows:

- Section 2.0 provides a description of the landfill with operational information and estimated emissions of air toxics;
- Section 3.0 describes the air dispersion modeling and the parameters used by the model, such as the model options, source parameters, receptor locations, meteorological data, and organization of the input and output files;
- Section 4.0 explains the exposure factors and risk assessment methodology, as well as the methods used to evaluate the dust deposition and odor impacts;
- Section 5.0 presents the results of the health risk, dust deposition, and odor analyses;
- Section 6.0 presents the conclusions of the health risk, dust deposition, and odor analyses;

- Section 7.0 discusses the uncertainties;
- Section 8.0 presents a qualititative evaluation on landfill gas migration; and
- Section 9.0 presents the references.

This report has been prepared for the City of Chula Vista. The conclusions presented in this report represent ENVIRON's professional judgment based upon the information available and conditions that existed at the landfill. ENVIRON cannot guarantee that implementation of its recommendations will avoid enforcement action by a regulatory agency or litigation by environmental groups. In performing its assignment, ENVIRON had to rely upon publicly available information, analytical and monitoring data provided by others, and information provided by others. Accordingly, the conclusions in the report are valid only to the extent that the information provided to ENVIRON was accurate and complete. Nevertheless, ENVIRON found no reason to question the accuracy of the information it received.

This report is not intended as a substitute for legal advice, nor is it an exhaustive review of site conditions. ENVIRON makes no representations or warranties about the conditions of the site.

2.0 AIR EMISSION CALCULATIONS

The air emissions associated with the landfill operations include combustion emissions from internal combustion engines and a flare that burns landfill gas, fugitive emissions of landfill gas from the landfill surface, combustion emissions from on-site mobile equipment that burn diesel, combustion emissions from delivery trucks that burn both diesel and gasoline, and fugitive emissions from various landfilling activities such as cover material quarrying, cover material application, dust entrainment from paved and unpaved roads, wind erosion from unpaved areas and disturbed landfill areas, and stockpile handling. The methods used for calculating the emissions of various air toxics from these sources are presented below:

2.1 Landfill Gas Emissions

Landfill gas (LFG) is generated during the natural process of bacterial decomposition of organic material contained in the municipal wastes. By volume, LFG typically contains 45% to 60% methane and 40% to 60% carbon dioxide. LFG also includes small amounts of nitrogen, oxygen, ammonia, sulfides, hydrogen, carbon monoxide, and less than 1 percent of non-methane organic compounds (NMOCs) such as trichloroethylene, benzene, and vinyl chloride, as well as trace amounts of inorganic compounds.

Otay Landfill has installed an LFG collection system. The collection system captures a majority of the LFG, with the uncollected LFG being emitted from the landfill surface as fugitive emissions. The system routes a portion of the collected LFG to a flare and the remaining portion of the collected LFG to two internal combustion engines (ICEs). The flare burns 98 percent of the organic compounds in the LFG routed to it. The ICEs burn LFG to generate power at the on-site power plant. The following steps were used to calculate the emissions of air toxics from the combustion of LFG in the ICEs and the flare. Emission calculation tables are presented in Appendix A.

2.1.1 LFG Generation Rate

Since the LFG generation is a long-term process, it is difficult to predict the variation of the generation rate during a short period of time (e.g. hourly, or daily) due to incremental changes in ambient temperature, moisture, and waste composition. Annual LFG generation rates can be estimated by using a theoretical first-order kinetic model of methane production

developed by the United States Environmental Protection Agency (USEPA). The annual LFG generation rates used in this evaluation were estimated by SCS Engineers (SCS), who modeled the LFG generation rates using site-specific data in conjunction with the USEPA model. The estimated LFG generation rate for each year from 1963 to 2076 are listed in Table A-1. The maximum LFG generation is at year 2020, when the landfill reaches its maximum placement capacity. The LFG flow rate averaged over the peak 30-year period (2010-2040) was used as the LFG generation rate for the health risk assessment. Both the peak LFG generation rate and the average LFG generation rates (from 2010 to 2040) were used to evaluate the potential odor impact.

According to the USEPA (AP-42, Chapter 2.4), LFG collection systems are not 100% efficient in collecting LFG. Reported collection efficiencies typically range from 60% to 85%, with an average of 75% most commonly used. In this evaluation, ENVIRON relied on the 80% collection efficiency reported by SCS' evaluation of Otay Landfill's collection system.

2.1.2 Concentrations of LFG Constituents

ENVIRON used the results of LFG sampling done in July 2002 by SCS to generate the concentrations of LFG constituents. Table A-2 presents the concentrations of various LFG constituents. If a particular compound was reported as non-detect, half of the detection limit was used. ENVIRON also used the USEPA's default values in AP-42; Chapter 2.4 for estimating the concentrations of hydrochloric acid (HCl) and mercury.

2.1.3 Emissions from LFG Combustion in ICE and Flare

ENVIRON calculated the controlled LFG emissions from the flare based on the destruction efficiency of 98% as recommended by the San Diego Air Pollution Control District (SDAPCD) guidance document on landfill operations. For the ICEs, ENVIRON relied on the equipment's air permit conditions that require 98% destruction efficiency for all compounds. The emission calculations from the flare and the ICEs are presented in Tables A-3 and A-4, respectively. The maximum heat input ratings of the flares and ICEs were used for calculating the maximum 1-hr emission rates.

2.1.4 Fugitive Emissions of LFG from Landfill Surface

Since the LFG collection system captures only 80% of the LFG generated, the remaining 20% LFG is released from the landfill surface as fugitive emissions. The fugitive emissions of LFG from the landfill surface are presented in Table A-5.

2.2 Fugitive Emissions from Landfilling Activities

Fugitive emissions in the form of particulate matter (PM) occurs from various landfilling activities such as cover material quarrying and application, dust entrainment from the movement of the landfill equipment including waste delivery trucks traveling on paved and unpaved roads, wind erosion from unpaved surface and disturbed landfill areas and stockpile handling. The air toxics emitted from these activities consist of trace metals found in the soil. ENVIRON used the results of sampling done by URS in April 2002¹ from the unpaved and cover soil to estimate the concentrations of various toxic metals in the dust. The results of the URS sampling are presented in Table A-6. ENVIRON used the maximum value of the two samples for each metal to be conservative. The emission calculations for the various landfilling activities resulting in fugitive emissions are described below:

2.2.1 Cover Material Quarrying and Application

ENVIRON used the SDAPCD default emission factor to calculate the emissions of PM₁₀ and PM from cover material quarrying and associated activities. The SDAPCD emission factor is a composite emission factor, which includes the emissions generated from all activities related to quarrying (i.e., excavation, quarry vehicles, bulldozing, and loading of the transport trucks). As instructed by the SDAPCD, the same emission factor was also used to estimate the PM₁₀ and PM emissions from cover material application. The emission calculations for the cover material quarrying and cover material application are presented in Tables A-7 and A-8, respectively.

2.2.2 Dust Entrainment from Paved Roads

The movement of vehicles on the paved road generates PM emissions. The information on the vehicles (vehicle weight, horsepower [HP], number of tires, etc.), both for the delivery trucks and on-site mobile equipment, is presented in Table A-9. AP-42 equation 13.2.1.3 (1)

¹ Calscience Environmental Laboratories, Inc., 2002. Laboratory Analysis Report, Trace Metal Analysis, April 19, 2002.

was used to calculate the dust entrainment emissions from paved roads. Table A-10 presents the dust entrainment emissions from paved roads.

2.2.3 Dust Entrainment from Unpaved Roads

AP-42 equation 13.2.2.2 (1a) was used to calculate the dust entrainment emissions from unpaved roads. Table A-11 presents the dust entrainment emissions from unpaved roads. A control efficiency of 80% was used, which is the AP-42 recommended default for facility using watering as a control measure.

2.2.4 Wind Erosion of Unpaved Roads and Active Landfill Areas

Emission factor from AP- 42; Table 11.9-4, wind erosion of exposed areas for the coal mine was used to calculate the wind erosion emissions from unpaved roads and disturbed active landfill areas. Table A-12 presents the emissions from wind erosion.

2.2.5 Emissions from Stockpile Handling

AP-42 equation 13.2.4 was used to calculate the PM emissions from stockpiling operations. Table A-13 presents the emissions from stockpiling operations.

2.2.6 Emissions of Toxic Metals from Various Landfilling Activities

Table A-14 summarizes the emissions calculation of toxic metals from the various described above. The emissions of toxic metals were calculated as:

$$E_{\text{toxic metal}} = E_{\text{PM10}} \times Conc_{\text{toxic metal}}$$

where,

 $E_{PM10} - PM_{10}$ emission from the landfilling activity $Conc_{toxic\ metal} - Concentration$ of toxic metal in soil

2.3 Emissions from On-Site Diesel Mobile Equipment and Delivery Trucks

The emissions of the on-site mobile equipment were estimated using the California Air Resources Board (CARB) emission model for off-road equipment (OFFROAD), the off-road equipment population, and the activity data provided by Otay Landfill for the on-site mobile equipment. For the delivery trucks, the emission estimates were generated using the CARB emission model for on-

road vehicles (EMFAC2002) and the activity data provided by Otay Landfill. Appendix B provides a detailed description on the emission calculation methodology used for estimating the emissions.

For the purposes of this evaluation, the average PM emissions from years 2010 to 2040 were used to calculate the cancer risks and non-cancer health impacts. The average PM emissions from years 2010 to 2040 were estimated assuming that the landfill would have the same number of off-road equipment and on-road vehicles operating in the same manner as current operations (e.g., same usage hours, vehicle miles traveled, etc.). The major difference between the current year emissions (2004) and the average 2010-2040 emission estimates would be that the landfill would have lower emitting off-road equipment and on-road vehicles because of the 2006 ultra low sulfur diesel (ULSD) fuel and 2007 heavy-duty diesel vehicles (HDDVs) emission standard regulations, as well as the Tier 4 off-road engines (USEPA Final Rule²), which will phase in from 2011 to 2015.

To estimate the emissions for on-road heavy-duty vehicles, 2010 and 2020 emission factors were generated using the EMFAC model; the 2020 calendar year is the upper bound of the modeling year range in the EMFAC model. Nevertheless, the 2020 emission factors for on-road vehicles account for the 2006 ULSD fuel and 2007 HDDV emission standards. Emissions in year 2040 were assumed to be the same as those of 2020. The average emissions were then calculated using 2010, 2020, and 2040 emissions for on-road vehicles.

For the off-road equipment, the emissions from the construction diesel equipment in the San Diego Air Basin for the 2004, 2010 and 2020 cálendar years were generated using the OFFROAD model. Using the 2004, 2010 and 2020 OFFROAD emission results, ratios of 2010/2004 and 2020/2004 were calculated. However, the OFFROAD model does not account for the Tier 4 off-road emission standards. The Tier 4 emission standards would reduce the PM emissions from the Tier 2/Tier 3 engines by more than 90%. It is very likely that the mobile equipment engines (with expected useful lifetime of 20 years or less) at the landfill would meet Tier 4 standards by 2040 since the new engines will be in the market from 2011 to 2015. Therefore, a 90% emission reduction was applied to the 2020 emission to estimate the year 2040 emissions, and the ratio of 2040/2004 was then calculated. The average emissions for the landfill off-road equipment were then calculated using the 2004 baseline emissions and the ratios. The average PM emissions from 2010 to 2040 would be 1.80 tons per year (tpy) without accounting for the Tier 4 regulation. With the Tier 4 reduction, the average emissions of 2010 to 2040 were estimated to be 1.35 tpy. Both emission scenarios (i.e., with or without the Tier 4 reduction) were included in the health risk assessment described later in this report.

11

ENVIRON

² Control of Emissions of Air Pollution from Non-road Diesel Engines and Fuel, EPA Final Rule, effective August 30, 2004.

The average 2010-2040 PM and air toxic emissions for the delivery trucks and on-site mobile equipment are shown in Tables A-15 and A-16, respectively.

3.0 AIR DISPERSION MODELING

The Industrial Source Complex – Short Term (ISCST3) model, a USEPA approved model, was used to simulate the air dispersion from the emission sources associated with the landfill operations. The ISCST3 model provides estimates of ground level concentrations at specified distances (i.e., receptors) from an air emission source using a coordinate system such as a Cartesian system.

3.1 Model Options

The following regulatory default options were used in running the ISCST3 model based on the USEPA guidelines³:

- 1. Final Plume Rise
- 2. Stack-tip Downwash
- 3. Buoyancy-induced Dispersion
- 4. Use Calms Processing Routine
- 5. Not Use Missing Data Processing Routine
- 6. Default Wind Profile Exponents
- 7. Default Vertical Potential Temperature Gradients
- 8. "Upper Bound" Values for Supersquat Buildings
- 9. No Exponential Decay for URBAN/Non-SO₂

The land use around the landfill was considered as urban area, which was evaluated using the Auer method as specified in the USEPA guidelines on air quality models cited above. The Auer method defines an area as urban if the land-use types of industrial, commercial, and residential account for 50% or more within a 3-kilometer circle.

The topography within the receptor network of Parcel A and B has an elevation difference of about 50 meters between the highest (125 meters) and the lowest (74 meters) points. Some of the receptors are located below the base elevation of stacks, some located below the tip of the stacks (simple terrain), and some others located above the tip of the stacks (complex terrain). The ISCST3 model provides a non-default option of HE>ZI⁴ to address the scenario where the receptors are below the

13

³ Guidelines on Air Quality Models. Appendix W, 40 CFR 51, April, 2003.

⁴ A non-default option of HE>ZI is to address a potential problem that may occur for cases when the receptor elevation is below the stack base elevation. In these cases the mixing height (ZI), which is terrain-following, may drop below the plume centerline height (HE), which is horizontal, resulting in anomalously large concentrations due to the actual plume approaching the centerline of one of the image plumes in the Vertical Term.

stack base. However, ENVIRON's sensitivity analyses suggested that it was not necessary to use this non-default option of HE>ZI for the ISCST3 runs. The "elevated terrain" option was selected in the ISCST3 to allow the model to use either simple or complex terrain, whichever is applicable, based on the receptor elevations.

Building downwash is the effect of nearby structures on the flow of the plumes from their respective emission sources. Building downwash was considered for the building housing the ICEs. The USEPA-approved Building Profile Input Program (BPIP) was used to simulate the downwash effect.

3.2 Source Parameters

Emission source parameters required by the ISCST3 model included source type, emission rate, stack height, stack inside diameter, stack exit velocity, and stack gas temperature. The input source parameters for the various sources are presented in Tables 1a and 1b. As mentioned earlier in the report, the objective of this assessment was to perform health risk, odor, and nuisance analysis. The ISCST3 model was run using the unit emission rate (i.e., 1.0 gram per second [g/sec]) for both the health risk and odor analyses. Consequently, the predicted concentrations in the model output files are actually dispersion factors (i.e., χ/Q , $\mu g/m^3$ per g/sec), which are used by the risk model to calculate the risk values, as discussed later in this report. For the nuisance analysis, the ISCST3 model was run using the actual emission rate of the sources.

3.3 Source Grouping

ENVIRON adopted the following source grouping schemes based on the information provided by the landfill, the limitations of the ISCST3 model in terms of aspect (i.e., length/width) ratio for area sources, and the engineering judgment:

- (1) Air emissions from the 475 diesel fueled waste delivery trucks per day were modeled as four point sources located along the roads that the truck travel, namely Delivery Truck 1 through 4 in the ISCST3 model. The same assumption was applied to gasoline fueled waste delivery trucks as well. Two "Point Sources" were used to represent the emissions from the 50 per day gasoline trucks. Therefore, in ISCST3 model six (6) waste delivery trucks (4 diesel fueled and 2 gasoline fueled) were created throughout the landfill;
- (2) Four "Point Sources" were used to represent the on-site mobile equipment at the landfill. The five dozers were grouped into a single dozer point source, three compactors were grouped into a single compactor point source, two scrapers were

grouped into a single scraper point source, and the remaining five pieces of equipment were grouped and represented by a single grader point source. The locations for these sources were chosen to represent their actual operating areas and accordingly these sources were placed on the active landfill areas;

- (3) Seven rectangular area sources were created in the ISCST3 model to represent the surface area of paved roads, because area sources cannot have an aspect ratio greater than 10 in the ISCST3 model. The total surface area of these seven rectangular sources matches the surface area of the actual paved roads within the landfill;
- (4) In lieu of reproducing the actual unpaved road system in the model, two rectangular area sources were used. The total surface area of unpaved road was estimated at approximately 8 acres. Two rectangular area sources were placed near Parcel A and Parcel B for conservative simulation;
- (5) A single rectangular area source was used for several stockpiles at the landfill; and
- (6) Three rectangular area sources were created in the model to replicate three active landfill areas.

Figure 3 illustrates the various emission source locations used in the ISCST3 model.

3.4 Description of Receptors

The receptors used in the modeling were identified either by a Cartesian grid network or discrete Cartesian coordinates, both using the three-dimensional UTM coordinates. For PM_{10} concentration and odor modeling runs, the receptor height was set at 1.5 meters above ground, at an average person's breathing level. The following sets of receptors were generated and included in the model runs:

Fenceline Receptors: Discrete Cartesian UTM coordinates were used to identify the receptors along the facility's property boundary using a fine receptor spacing of 50 meters. This set included 142 receptors.

Receptor Grid Networks: The Cartesian grid receptor network is a regularly spaced square grid. In this modeling, two receptor grids were generated, one is built over Parcel A area and another one is built over Parcel B. The Parcel A receptor grid network is at 50-meter intervals in each direction

containing 198 receptors. The Parcel B receptor grid network is at 50-meter intervals in each direction containing 170 receptors.

No receptor within the facility's boundary was included in the model.

3.5 Meteorological Data

Otay Landfill is located in San Diego County. As recommended by the San Diego Air Pollution Control District (SDAPCD), the surface meteorological data for Chula Vista (Station number 72290) and the upper air data for Miramar (Station number 3190) were used. The meteorological data from both the stations were processed using PCRAMMET to format the data into an ISCST3 model ready format. Data substitution was performed using the Atkinson-Lee method for missing data. The meteorological data for three years, from 2001 to 2003, were used for all model runs. Of the three years, the highest health risks were for the year 2002, hence this year was considered as more conservative. The wind rose plot for the year 2002 is presented in Figure 3. As shown on the wind rose, wind in the vicinity generally comes from the West. A more detailed report on the meteorological data processing is provided in Appendix C.

3.6 Terrain Data

Otay Landfill is situated in a complex terrain area. In the ISCST3 modeling, the 1-degree Datum data from United States Geological Society (USGS) for San Diego-East and San Diego-West were used to process the terrain profile around the facility. The DEM files from USGS were imported into the ISCST3 model and the model calculated the elevations of the sources and receptors. The model uses an interpolation scheme to calculate the exact elevations of the sources and the receptors. As described earlier, due to the dynamic changes on landfill surface elevations this model analysis manually set elevation at 192 meters⁵ for the following sources, the location of which will change over time:

- (1) Landfill 1 through Landfill 3;
- (2) Stockpile;
- (3) Unpaved Road 1 and 2;
- (4) Diesel truck No. 4 and gasoline truck No. 2 (on unpaved road); and
- (5) Landfill heavy equipment including dozer, compactor, scraper, and grader.

⁵ 192 meters was calculated by averaging the current landfill surface elevation of 163 meters and the expected highest elevation of landfill surface of 221 meters.

3.7 Input and Output Files

The ISCST3 model input file created by HARP for the health risk analysis is included in Appendix D. The ISCST3 input file and the excerpts from the output files for the deposition analysis are presented in Appendix F. Appendix G presents the ISCST3 input and excerpts form output file for the odor analysis for Hydrogen Sulfide and Appendix H presents the ISCST3 input and excerpts form output file for the odor analysis for Acetaldehyde.

17

4.0 METHODOLOGY

4.1 Health Risk Analysis Method

This section provides a brief discussion on the method used for human health risk analysis.

4.1.1 HARP Software

The health risks were calculated using the Hotspots Analysis and Reporting Program (HARP) Version 1.1(Build 23.02.21). HARP is a tool that incorporates the programmatic requirements of the Air Toxics "Hot Spots" Program. It is a computer software package that combines the tools of emission inventory database, facility prioritization, air dispersion modeling, and health risk analysis. The organization of HARP can be briefly described as follows:

- CEIDARS-Lite Database: The main component of HARP is the CEIDARS-Lite database from which all the analysis tools are connected. CEIDARS-Lite can be used to organize and manage criteria and toxics emissions from facilities. This essentially is the emission inventory module of HARP.
- Air Dispersion Analysis: This tool allows easy utilization of the facility emissions data from the CEIDARS-Lite database to perform the air dispersion analysis. This module uses only ISCST3 as the air dispersion model.
- Health Risk Analysis: This portion of the HARP performs health risk analyses, that follow the OEHHA guidelines6. The risk analysis tool integrates the CEIDARS-Lite database and the results of the air dispersion analysis so that risk calculations can be performed within the same program.

Appendix E presents the HARP output file for the residential scenario.

⁶ Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessment (OEHHA, 2003).

4.1.2 Exposure Pathways

The OEHHA guidelines recommend that, in addition to the inhalation pathway, non-inhalation primary and secondary exposure pathways be evaluated for multi-pathway pollutants. The primary non-inhalation pathways include dermal exposure, water ingestion, soil ingestion, and crop ingestion (direct deposition). The secondary non-inhalation pathways include ingestion of mother's milk, meat, eggs, dairy products, and crop ingestion (root uptake). All of these exposure pathways were evaluated for applicability to the Otay Landfill and the following pathways were included in the HRA for residential exposure:

- Inhalation
- Dermal exposure
- Soil ingestion
- Home grown produce
- Mother's milk

The water ingestion pathway was not considered, as there is no water body in Parcels A and B that the future residents would use as a source for drinking water. For the worker scenario, the three applicable exposure pathways considered were inhalation, dermal contact and soil ingestion.

4.1.3 Carcinogenic Health Effects

As mentioned earlier, HARP was used to calculate the health risks from the air emission sources associated with the operations of Otay Landfill. For carcinogens, HARP uses the corresponding unit risk factors (URFs) for computing cancer risk through inhalation. If the carcinogen is a multi-pathway pollutant, HARP uses the cancer potency slope (CPS) to estimate the risk from non-inhalation pathways.

Risk assessment modeling for the residential exposure scenario assumed continuous lifetime exposure duration of 30 years. The underlying assumption is that the residential population would remain at the same location for the entire 30 years. This assumption is also consistent with the emission calculations for which the peak 30 years of LFG generation was used.

4.1.4 Non-Carcinogenic Health Effects

In the analyses of non-carcinogenic health effects, it is generally assumed that a threshold exists below which no adverse health impacts are expected. The concept of a threshold is based on studies that indicate the body can tolerate low levels of exposure. The types of non-carcinogenic health effects vary depending on the pollutant, the magnitude of exposure, and the duration of the exposure. These health effects can generally be classified into acute exposures (short-term exposures) and chronic exposures (long-term exposures).

Acute and chronic reference exposure levels (RELs) for inhalation pathway and reference doses (RfDs) for non-inhalation pathway were used to evaluate non-cancer health effects. The non-carcinogenic hazard indices were computed for both chronic and acute exposures using their respective toxicological endpoints (or target organs).

The use of a hazard index approach is recommended in the OEHHA Guidelines to evaluate the cumulative non-carcinogenic health impacts of a mixture of compounds. The hazard index approach assumes that the health effects of a chemical mixture to a given target organ are additive. The hazard index is calculated by dividing the estimated exposure (ground level concentration) to a given substance by the REL for that substance or dividing the dose level by the RfD for that substance.

 $\begin{tabular}{lll} Exposure_i \\ Hazard\ Index = \ \Sigma \\ \hline & Health\ Standard_i \\ \hline \end{tabular}$

Where:

i = the number of pollutants being evaluated.

The hazard index evaluates certain groups of substances that exert their effect on the same target organs. Therefore, a hazard index is calculated for each target organ. The chronic hazard index is based on the annual average emissions and the modeled annual average concentration, whereas the acute hazard index is based on the maximum 1-hour emissions and the modeled maximum 1-hour concentrations. The total hazard index for a target organ is computed as the sum of the hazard indices of all pollutants affecting the same organ.

4.2 Fallout Nuisance Dust Analysis Method

This section discusses the method used for conducting the nuisance dust analysis. The nuisance analysis focused on the fugitive PM emissions from the various landfilling activities at Otay Landfill. The sources of fugitive emissions at the landfill have been presented in Section 3 of the

report. Particles having size less than 100 micrometers (µm) were treated as nuisance dust for the purpose of this analysis.

The ISCST3 model was run to estimate the PM deposition impacts from the various sources using the actual PM emission rates from the sources; and hence the modeled results were actual deposition rates at the receptors. The historical average annual rainfall is quite low for the County of San Diego, hence, only dry deposition calculations were performed. In the absence of any state or federal regulations quantitatively relating to nuisance dust deposition, the modeled deposition results were compared with thresholds in peer-reviewed publications, which are frequently cited in environmental impact analyses.

4.3 Odor Analysis

This section discusses the methodology ENVIRON used to assess the odor impact on Parcel A and Parcel B due to the landfill operations. The odor impact analysis consisted of the following key steps:

4.3.1 Identification of Odor Emission Sources

ENVIRON identified the following sources, which could emit chemicals that have odor impacts:

- LFG combustion in flare and ICEs
- Fugitive emissions of LFG from landfill surface
- Diesel and gasoline combustion emissions from on site mobile equipment and waste delivery trucks

4.3.2 Calculation of the Odorous Compounds' Emission Rates from Each Source

ENVIRON used Hydrogen Sulfide and Acetaldehyde as surrogate chemicals to evaluate the odor impact from LFG emissions and mobile sources emissions respectively. These chemicals were chosen as they have relatively lower odor thresholds as compared to other chemicals emitted from these sources. Since odor impacts are short-term impacts, ENVIRON used the maximum heat input rating for the ICEs and flare to calculate the maximum 1-hr emissions from these sources. For estimating the fugitive emissions of LFG from landfill surface, two scenarios were evaluated; peak LFG generation rate for year 2020 and average LFG generation rate for years 2010-2040. ENVIRON used the 20% (the LFG

control system has a capture efficiency of 80% as mentioned earlier in the report) of the LFG generation rate to calculate the emissions.

4.3.3 Calculation of the Ground-Level Concentration of the Odorous Species

The ISCST3 model was run using the unit emission rate (i.e., 1.0 gram per second [g/sec]) for the odor analysis. Consequently, the predicted concentrations in the model output files are actually dispersion factors (i.e., χ/Q , $\mu g/m^3$ per g/sec), which were used to calculate the maximum 1-hr concentration for odorous compounds. The maximum 1-hr ground level concentration was further converted to a 3-min concentration using the following equation⁷:

$$\chi_s = \chi_k (T_k / T_s)^p = \chi_k (3/60)^p$$

where,

 χ_s – the concentration for the averaging time Ts (i.e., 1 hour)

 χ_k – the concentration for the averaging time T_k (assumed to be 3 minutes)

p - a constant between 0.17 and 0.2 (used 0.2)

The predicted ground-level concentrations will be higher when using a greater value of p. In this analysis, 0.2 was used to estimate the 3-minute peak concentration.

4.3.4 Comparison of the Ground-Level Concentrations with Odor Thresholds

The calculated worst-case 3-minute ground-level concentrations of hydrogen sulfide and acetaldehyde were compared with the odor thresholds published by the American Industrial Hygiene Association (AIHA). Odor thresholds used in this evaluation were defined as the lowest odorant concentration at which 50% of the people can ascribe a definite character to the odor. The geometric means of the AIHA critiqued thresholds were used as the principle to evaluate the odor nuisance, considering these mean values represent the best estimate of the odor thresholds.

⁷ Workbook of Atmospheric Dispersion Estimates: An Introduction to Dispersion Modeling. D. Bruce Turner, 1994.

⁸ Odor Thresholds for Chemicals with Established Occupational Health Standards. American Industrial Hygiene Association, 1989.

5.0 RESULTS AND DISCUSSIONS

5.1 Results of the Health Risk Evaluation

This section discusses the results of the health risk analysis, both cancer and non-cancer health effects. Excess individual cancer risk of 10 in a million is a generally accepted significant cancer risk threshold. The significance threshold used to evaluate the non-cancer health impacts in this study is 1.0 for HIA and HIC. The health impacts, both cancer and non-cancer, at the maximally exposed resident are expected to be higher than those at the maximally exposed non-residential receptors such as commercial receptors.

5.1.1 Cancer Risks

Tables 2A through 3B and the table below summarize the results of cancer risk estimates from the landfill operations for receptors in Parcel A and Parcel B. The table below summarizes the predicted cancer risks at the potential maximum exposed individual resident (PMEIR or MEIR) with and without the Tier 4 90% PM emission reduction for the off-road engines. As can be seen from the table below, the MEIR has a cancer risk less than ten (10) in a million for both Parcel A and Parcel B. Figure 5 presents the cancer risk isopleths (with the Tier 4 reduction) for the land parcels showing the areas having risks greater than 10 in a million, which is within the landfill boundary. The 5 in a million contour has also been plotted on Figure 5 for informational purposes. The on-site mobile sources, namely the scrapers, dozers, compactors and graders are the highest contributors to the cancer risk. The contributions from various sources to the cancer risk are presented in Table 2A and 2B. Diesel exhaust particulate matter is the highest contributing chemical to the cancer risk in all scenarios.

Summary of Cancer Risk Estimate

A TOTAL AND AND	Maximum Cancer	Risk in a Million
Receptor Scenario	Parcel A	Parcel B
Residential (with Tier 4)	7.9	7.6
Residential (without Tier 4)	8.7	8.2

As recommended by the State of California Office of Environmental Health Hazard Assessment (OEHHA) in Air Toxics Hot Spots Risk Assessment Guidelines.

23

ENVIRON

5.1.2 Non-Carcinogenic Health Impacts

Tables 4A through 7B and the table below summarize the non-carcinogenic health impacts from the landfill on Parcels A and B. The acute hazard index (HIA) for the worst-case receptor for both Parcel A and Parcel B is less than 1. The on site mobile equipments are the highest contributors to the HIA, with Formaldehyde being the highest contributing chemical. The chronic hazard index (HIC) is less than 1 for all the receptors in both the land parcels, with Manganese being the highest contributing chemical.

Summary of Non-Carcinogenic Health Impacts

Non-Cancer Hazard Index	Parcel A	Parcel B
Acute Hazard Index (HIA)	0.64	0.63
Chronic hazard Index (HIC)	0.02	0.031

5.2 Results of the Nuisance Analysis

The table below provides summary of the ground level PM deposition in grams per square meter per year (g/m²-yr) for the maximally impacted receptors in Parcel A and Parcel B. Table 8 provides the particle size distribution used in the deposition analysis. There are currently no federal or California regulatory standards for nuisance dust deposition. The suggested guidelines¹⁰ for deposited ambient dust in the United States range from 183 to 267 mg/m² per day, equivalent to 67 to 97 g/m² per year. In addition, deposition rates in the range of 69.6 to 87 g/m²-yr have been perceived as objectionable, which are generally in the same range as the U.S. suggested guidelines. Examples of dust deposition standards outside of the US are provided in Table 9. Documented¹¹ public response levels related to dust deposition rates are summarized in Table 10. The deposition contours of 67 to 97 g/m² per year are presented in Figure 6. It should be noted that the dust fallout or deposition on individual days could be caused by unpredictable wind gusts and other short-term meteorological conditions, which may result in complaints from the receptors living or working in the areas outside the isopleths as shown on Figure 6.

¹⁰ H.W.Vallack and D.E.Shillito "Suggested Guidelines for Deposited Ambient Dust" *Atmospheric Environmental* Vol. 32, 1998.

www.quarry.leeds.ac.uk/goodquarry article

Annual Averaged PM Depositions (g/m²-yr)

	20	003	20	02	200	1	Suggested
	Parcel A	Parcel B	Parcel A	Parcel B	Parcel A	Parcel B	Guidelines for US
Maximum	100.0	110.1	90.4	108.1	115.7	98.3	67-97

5.3 Results of the Odor Analysis

Table 11 and the table below present comparisons of the modeled 3-minute concentrations of hydrogen sulfide (H₂S) and acetaldehyde with their respective odor thresholds. The predicted H₂S concentrations are higher than the odor thresholds for both Parcel A and Parcel B, which implicates potential odor nuisance. Figure 7a and 7b present the isopleths of maximum 1-hr concentrations of H₂S. For developing these isopleths, the odor threshold of 0.0045 ppm for H₂S¹² was converted into a maximum 1-hr concentration using the Turner's method discussed in Section 4.0. In addition to the isopleths that present the maximum 1-hour average concentrations at all receptors, ENVIRON also analyzed how many hours during a one-year period that the predicted H₂S concentrations are likely to exceed the odor threshold using the most conservative 2003 meteorological data. The results showed approximately 1.2% in a year (i.e., 111 hours out of 8,760 hours) that the predicted concentrations would exceed the odor threshold at one or more receptors on the two land parcels.

It should be noted that the odor evaluations were performed based on normal operation conditions. The odor nuisance may be worse during periods of flare maintenance when the LFG is emitted from the landfill surface. In addition, there may be other odor-causing compounds in the LFG (e.g., methyl mercaptan and ethyl mercaptan) that have much lower odor thresholds than that of H₂S, for which the analytical data were not provided to ENVIRON. The potential odor impacts of those compounds were not evaluated in this study.

25

¹² Since odor is a short term impact, the odor threshold of 0.0045 ppm was assumed to be a 3-min concentration.

Comparison with Odor Thresholds

Odor Surrogate		n Ground Level ation (ppm)	Odor Threshold (ppm)
	Parcel A	Parcel B	
Hydrogen Sulfide (peak LFG generation rate)	0.0157	0.0190	0.0045
Hydrogen Sulfide (average LFG generation rate)	0.0124	0.0151	0.0045
Acetaldehyde	0.0071	0.0068	0.067

6.0 CONCLUSIONS

6.1 Health Risk Analysis

The excess individual cancer risk of 10 in a million and non-cancer risk of 1.0 expressed as hazard index are generally accepted health risk thresholds by the State of California 13. The SDAPCD also considers cancer risks less than 10 in a million as acceptable under SDAPCD regulations and California Environmental Quality Act (CEQA) guidelines. The cancer risk isopleth of 10 in a million is within the landfill boundary for the residential scenario. The non-cancer acute and chronic hazard indices for the maximally exposed receptors in Parcels A and B are less than the significance threshold of 1.0. Therefore, ENVIRON concludes that the cancer risks and the non-carcinogenic health impacts for the proposed residents on Parcels A and B are less than significant. Because the exposure durations of other types of receptors (such as a commercial receptor or a visitor) are expected to be much shorter than those of the residents, the cancer and non-cancer health risks for those receptors are also expected to be less than significant.

6.2 Nuisance Dust Analysis

In the absence of any California state or federal standards, ENVIRON has relied on guidelines available in peer reviewed publications to draw its conclusion for the nuisance dust deposition analysis. As discussed in the results section, the predicted dust deposition rates for the maximally exposed receptors in Parcels A and B exceeded the suggested guidelines of 67 to 97 g/m²-yr. Approximately 20% of the area in Parcel B and approximately 5% area in Parcel A have deposition rates greater than 67 g/m²-yr. In those areas, nuisance dust could be a significant issue for the residential or industrial receptors. In addition, short-term wind conditions could cause much worse daily dust deposition problems covering a much larger area on the two land parcels.

6.3 Odor Analysis

The results of the odor analysis indicate that the H₂S emitted from the landfill operations produces concentrations that are higher than the odor thresholds for one or more receptors in Parcels A and B during approximately 1.2 percent of the time over a one-year period. Although odor is a highly subjective matter, these results implicate that there could be odor related complaints if the land

27

ENVIRON

¹³ As recommended by the State of California Office of Environmental Health Hazard Assessment (OEHHA).

parcels are developed as residential. Furthermore, the odor impact is expected to be more noticeable during the flare maintenance periods when most of the LFG is being emitted from the landfill as fugitive emissions.

7.0 UNCERTAINTY ANALYSIS

ENVIRON has used appropriate engineering and scientific methods in the health risk analysis, nuisance dust, and odor impact analyses presented in this report. However, there is a great deal of uncertainty associated with the process of risk assessment. Uncertainty may be defined as what is not known and maybe reduced with further scientific studies. The uncertainty arises from lack of data in many areas necessitating the use of assumptions. Sources of uncertainty, which may either underestimate or overestimate the off-site impact, include:

- Emission estimates
- Air dispersion models
- Exposure estimates
- Toxicity data
- Wind gusts
- Odor thresholds

This section discusses the uncertainties associated with the sources outlined above. In general, a reasonably conservative approach was used throughout the risk assessment.

7.1 Emission Estimates

The emission estimates from the landfill are based on LFG modeling and composition analysis, emission factors, and engineering calculations. As discussed in Section 2.0 of the report, most of the emission sources at the landfill are fugitive. ENVIRON has used emission factors from SDAPCD and engineering equations from AP-42 to estimate emissions from these sources. The default emission factors from SDAPCD are generic in nature and not site-specific and hence introduce uncertainty in emission estimates. The equations from AP-42 used to estimate emissions contain certain parameters such as silt loading, moisture content, etc. that vary from site to site. ENVIRON has relied on the values available for municipal solid waste landfills in AP-42 to estimate the emissions. The use of non site-specific parameters introduces a level of uncertainty and may over /under estimate the emissions. The emissions from the on-site mobile sources and the delivery trucks have been estimated assuming that certain risk reduction measures that the CARB plans to implement in the future will be implemented by the landfill. This assumption introduces a level of

uncertainty in the emission estimates and under estimates the potential impact if the control measures are not implemented.

7.2 Air Dispersion Modeling

The ISCST3 model, the sir dispersion model used in this analysis, utilizes Gaussian dispersion equation and a number of assumptions to determine the ground level concentrations and depositions of various pollutants. Sensitivity analyses conducted on Gaussian dispersion models have concluded that it is unrealistic to expect the dispersion models to consistently predict real world pollutant concentrations, which introduces a level of uncertainty in the risk assessment.

7.3 Exposure Assessment

Conservative assumptions on exposure likely overestimate the risks for the residential receptors. For the health risk analysis it has been assumed that the residents are exposed for 24 hours per day, 365 days per year for 30 years at the same location. However, residents usually leave their houses on daily basis for work, shopping, errands, etc. USEPA's data indicate that the residents typically do not live in the same residence for 30 years. In addition, there is a natural range or variability in the human population in such properties as height, weight, and susceptibility to air toxicants.

7.4 Toxicity Data

Uncertainty in toxicity data include:

- The differences among species and human populations cannot be easily quantified and incorporated into risk analysis. Factors including metabolism, target site sensitivity, diet, immunological responses, and genetics may influence the response to toxic pollutants.
- Uncertainties in the assumptions underlying the dose-response level used.
- Extrapolation from large experimental doses, where, for example, other toxic effects mat compromise the assessment of carcinogenic potential, to usually much smaller environmental doses.
- Lack of data on absorption efficiencies for most compounds.

 Lack of knowledge about interactions from simultaneous exposures to a number of compounds, i.e., synergistic or antagonistic effects that could over or under estimate the risks.

Therefore, the risk estimates generated by this health analysis should not be interpreted as the expected rates of disease in the exposed population but rather as estimates of potential risk, based on current knowledge and a number of assumptions.

7.5 Wind Gusts

The nuisance dust analysis presented in this report represents dust deposition (i.e., dust fallout) over a one-year period. However, nuisance dust event is often caused by sudden wind gusts, which is completely unpredictable and was not evaluated in this report.

7.6 Odor Thresholds

Odor is a subjective matter; reactions to odor vary from one person to another significantly. The published odor thresholds often have a wide range for a particular chemical due to the variability in the individual responses. Other odor-causing chemicals may be emitted from the landfill, for which there are no established odor thresholds. The potential odor impacts from those chemicals are not evaluated in this report.

8.0 LANDFILL GAS MIGRATION QUALITATIVE EVALUATION

ENVIRON qualitatively evaluated the potential for LFG migration beyond the landfill boundary. The findings and the potential impacts to the future residents adjacent to the landfill are discussed in this section.

8.1 Background

The wastes at Otay Landfill contain significant portions of organic materials that produce a variety of gaseous products, generally referred to as LFG. Anaerobic bacteria thrive in the oxygen-free environment, resulting in the decomposition of the organic materials and the production of LFG. LFG is composed of a mixture of hundreds of different gases. By volume, LFG typically contains 45% to 60% methane and 40% to 60% carbon dioxide. LFG also includes small amounts of nitrogen, oxygen, ammonia, sulfides (such as hydrogen sulfide), hydrogen, carbon monoxide, and non-methane organic compounds (NMOCs) such as trichloroethylene, benzene, and vinyl chloride. Methane, which is less soluble in water and lighter than air, is likely to migrate out of the landfill. LFG is created under the landfill surface and generally moves away from the landfill, either by rising up through the landfill surface or migrating underground to surrounding areas. Three factors influence where LFG migrates to, permeability of the landfill and its surrounding areas, diffusion (LFG moves to areas with lower gas concentrations), and pressure (LFG moves to areas of lower pressure; changing weather conditions affect LFG migration).

LFG released from the landfill could potentially represent physical (explosion), chemical (substances in ambient or indoor air), and/or physiologic or quality of life (odor) public health concerns for those who live and work near the landfill. One of the main concerns with methane is that it poses explosion hazard. Methane is explosive between its Lower Explosion Limit (LEL) of 5% by volume and its Upper Explosion Limit (UEL) of 15% by volume. Because methane concentrations within the landfill are typically 50% (much higher than its UEL), methane is unlikely to explode within the landfill boundaries. As methane migrates and is diluted, however, the methane gas mixture may be within the explosive range. Also, oxygen is a key component for creating an explosion. The biological processes that produce methane below the landfill surface are anaerobic (or oxygendepleted), which is an environment that does not support combustion or explosion. At the surface of the landfill, enough oxygen is present to support an explosion, but the methane gas usually diffuses into the ambient air to concentrations below the 5% LEL. In order to pose an explosion hazard, methane must migrate from the landfill and be present between its LEL and UEL.

32

8.2 LFG Migration Review

ENVIRON reviewed a report titled, Landfill Gas Remediation Plan, Otay Sanitary Landfill, 1700 Maxwell Road, San Diego, California (stamped as Draft), prepared by SCS Engineers, dated July 2002 (SCS, 2002). The Landfill Gas Remediation Plan was compiled to evaluate and develop a remediation plan for LFG issues at the Otay Sanitary Landfill (the Class III Landfill). The report stated that there was evidence of both deep and shallow off-site LFG migration in the vadose (unsaturated) zone beneath the landfill.

According to the SCS (2002) report, a lined cell was built in 1999 in the southern half of the landfill property, and was used in 2002 as the operating cell. Filling was next to be moved further east to a new lined cell that was to be built east of the cell being operated in 2002. SCS stated that in 2002, LFG control in the Class III landfill was comprised of two separately run systems. The first system was comprised of a network of approximately 90 to 100 extraction wells connected via header lines to a gas to energy facility that was operated by Covanta Energy. The second system was an LFG-fired flare that had been installed at the landfill in 2001. Nineteen multilevel perimeter probes had been installed at Otay Landfill (both Class I and III) to monitor migration of methane to the surrounding areas. The probes were monitored on a quarterly basis and were generally screened in the shallow (S), middle (M), and deep (D) zones. The surface of the landfill was also periodically monitored for the presence of surface emissions of methane.

According to the SCS (2002) report, methane migration had been observed in three perimeter probes, Probes G-2 and G-3 located on the southern perimeter of the landfill, and Probe GP-13 located on the northern perimeter of the landfill next to the southeastern corner of Parcel A (see Figure 8). For this probe, SCS noted that the pressure gradient pattern showed that the middle zone was the zone of greatest gas migration. SCS also noted that while no other probes detected methane, the reduced oxygen levels detected in many probes, including Probe GP-12 located at the southeastern side of Parcel A, were evidence of extensive LFG migration. SCS reviewed several alternatives as possible mitigation measures of LFG migration.

ENVIRON also reviewed a report titled, Addendum to Landfill Gas Remediation Plan, Otay Sanitary Landfill, 1700 Maxwell Road, Chula Vista, California, prepared by SCS, dated July 2003 (SCS, 2003). According to SCS, a further study of the LFG conditions at the landfill had been conducted by SCS after implementation of corrective measures recommended in SCS (2002). Methane concentrations at the deep zone of Probe GP-3 (Probe GP-D) were still above the regulatory limit (5% methane by volume). SCS noted that because the methane concentrations in Probe GP-13, which is located next to the southeastern corner of Parcel A, had consistently been

ENVIRON

below regulatory concentration levels, there was no need to further address mitigation measures for this probe.

SCS (2003) concluded that health and safety was not an issue because the methane concentrations in the probes did not place the public or employees at risk as there were no structures, residences, or any other receptors near the boundary of the landfill. As part of its additional mitigation measures for LFG migration in the southern area of the landfill, SCS recommended, among others,

- The installation of additional multi-nested gas probes between Probes GP-2 and GP-3.
- The installation of a larger capacity flare and blower system as the existing system appeared
 to be inadequate to control LFG migration, surface emissions, and odor concurrently. SCS
 noted that the installation of a 5,000 standard cubic feet per minute (scfm) flare system was
 anticipated by the end of 2003.

Regarding surface emissions, SCS (2003) stated that recent data had indicated surface emissions of total organic compounds (TOCs) greater than 500 parts per million by volume (ppmv) along south and southeast of the landfill in various locations. According to SCS, although those exceedances had been corrected, they might be indicative of inadequate collection capacity.

ENVIRON reviewed four tables, titled *Otay Landfill Probe Data*, which were prepared by SCS Field Services. These four tables, which include five LFG monitoring episodes conducted between November 15, 2004 and February 28, 2005, are dated (i) 10/1/2004 through 12/31/2004; (ii) 12/01/2004 through 12/31/2004; (iii) 1/01/2005 through 1/31/2005; and (iv) 03/02/3005 through 02/28/2005. During the latest episode, 23 probes were monitored, of which 15 probes were screened in all 3 zones, and the remaining probes were screened in 1 or 2 zones. The probes adjacent to the Parcel A boundary are Probes GP-10, GP-11, and GP-12 on the eastern side of the parcel, Probe GP-13 at the southeastern corner of the parcel, and Probe GP-14 and GP-15 on the southern side. No probes were installed along the eastern side of Parcel B; the closest probe to this parcel is Probe GP-21, which is approximately 500 feet east of Parcel B. The tables show that during the five monitoring episodes, the measured methane concentrations were zero percent for all six probes that are along the Parcel A boundary and for Probe GP-21 that is the closest one to Parcel B.

8.3 Conclusions and Recommendations

LFG data reviewed by ENVIRON show that there are no current data to indicate that LFG migration is taking place onto Parcels A and B. However, the probe coverage is rather sparse, especially for Parcel B. Based on ENVIRON's experience with landfills at other locations, the potential for

34

migration of LFG generated as a result of decomposition of buried wastes at Otay Landfill to Parcels A and B, cannot be ruled out. To ascertain the presence of LFG at Parcels A and B, a soil gas survey would need to be performed at these two parcels with emphasis on the areas along the common boundaries of these parcels with the landfill.

As stated by SCS (2002), while no probes other than Probes GP-2, GP-3, and GP-13 detected methane, the reduced oxygen levels detected in many probes, including Probe GP-12 located at the southeastern side of Parcel A, were evidence of extensive LFG migration from the landfill. Further, ENVIRON notes that as long as LFG is generated in the landfill, there is the potential for the migration of LFG to the surrounding areas.

Attention:

Mr. Yehudi Gaffen

Subject:

RANCHO DEL SUR PHASE II SAN DIEGO, CALIFORNIA

LIMITED SOIL-GAS, SOIL, AND

GROUNDWATER SAMPLING REPORT

Gentlemen:

In accordance with the request of Mr. Yehudi Gaffen, and the "Proposal" dated July 16, 1993 revised March 22, 1994, Geocon Environmental Consultants (GEC) has prepared this "Report" describing environmental engineering services performed for the subject site. The site is located south of Telegraph Canyon Road and east of Laurel and Brandywine Avenues in San Diego County, California. The southeastern corner of the project is located adjacent to the former Otay Landfill in the Otay Landfill Annex.

The environmental engineering services performed include the excavation of exploratory borings, the installation of temporary groundwater monitoring wells, limited soil/groundwater/soil-gas sampling and laboratory testing. The accompanying report summarizes the environmental engineering services performed and presents the results of the laboratory testing.

If there are any questions concerning the contents of this report, or if GEC may be of further service, please contact the undersigned at your convenience.

Very truly yours,

GEOCON ENVIRONMENTAL CONSULTANTS

LIMITED SOIL-GAS, SOIL, AND GROUNDWATER SAMPLING REPORT

INTRODUCTION

In accordance with the request of Mr. Yehudi Gaffen, and the "Proposal" dated July 16, 1993

revised March 22, 1994, Geocon Environmental Consultants (GEC) has performed environmental

engineering services for the subject site. The site is located south of Telegraph Canyon Road and

east of Laurel and Brandywine Avenues in San Diego County, California. The southeastern

corner of the project is located adjacent to the former Otay Landfill in the Otay Landfill Annex.

The site is identified by the County of San Diego Assessors Parcel Numbers (APN) 644-011-02

and 644-020-01, and is owned by GADCO/Resolution Trust Corporation. The approximate

location of the site is depicted on the Vicinity Map, presented as Figure 1.

The environmental engineering services performed include the excavation of exploratory borings,

the installation of temporary groundwater monitoring wells, limited soil/groundwater/soil-gas

sampling and laboratory testing. The accompanying report summarizes the environmental

engineering services performed and presents the results of the laboratory testing.

Background

It is understood that Portfolio Investments Ltd. (PIL) has participated in the purchase of a

Resolution Trust Corporation (RTC) loan pool comprised of properties of which the subject site

- 1 -

is a part. It is understood that the site borders an active Class III landfill facility (County of San Diego Otay Valley Landfill) and an inactive Class I facility.

Purpose

The purpose of the environmental engineering services performed is to provide additional information pertaining to the potential presence of hazardous materials within soil-gas, soils, and groundwater beneath the subject site.

Scope of Services

The scope of services performed is divided into four tasks: Task I - Limited Vadose Moisture Monitoring; Task II - Limited Soil Gas Monitoring; Task III - Temporary Groundwater Monitoring Well Installation; and Task IV - Limited Groundwater Sampling. The scope of services performed is outlined below.

Task I - Limited Vadose Moisture Monitoring

- Prepared a Health and Safety Plan outlining recommendations for personal protective equipment (PPE) for GEC workers during the field activities.
- Observed for the presence of liquid within the reservoirs of the three existing moisture monitoring wells onsite (Wells V1, V2, and V3).

Task II - Limited Gas Monitoring

- Removed the original well heads on the seven existing vadose gas monitoring wells
 at the site. Refurbished the gas sampling tubing/ports and reinstalled the security
 well covers.
- Collected soil gas samples from the twenty sampling probes within the seven existing vadose gas monitoring wells (Wells G1 through G7) for the potential presence of landfill gas including methane and hydrogen sulfide. A Model 224-PCXR3 SKC Universal Flow Sample Pump was connected to the tubing at the top of each well and pumped for 60 seconds to purge each probe. Gas samples were then extracted from each gas probe using the sample pump and collected in Tedlar bags.
- Obtained measurements of the tedlar bag samples using the MSA Model 361 meter (CGI) for the presence of combustible gases, percent oxygen, and hydrogen sulfide. Measurements were also obtained of the samples for the presence of total ionizable compounds using a Century Foxboro Model 128 Organic Vapor Analyzer (OVA), calibrated for response to methane.
- Submitted the tedlar bag sample to the laboratory for the sampling port exhibiting the greatest volatile organic concentration (as detected by the OVA) for testing for the potential presence of methane.

Task III - Soil Sampling/Temporary Groundwater Monitoring Well Installation

- Submitted an application to extend the expiration date of approved Well Permit No. W93683 for 120 days and to install an additional (second) groundwater monitoring well at the site. The well permit was originally approved for the installation of one groundwater monitoring well on July 29, 1993, extended on November 24, 1994, and March 24, 1994, and currently expires on July 29, 1994.
- Contacted local public utilities via Underground Service Alert (USA) (Ticket No. 728-063) to attempt to identify the locations of subsurface utilities/obstacles in proximity to the proposed boring and well locations. Performed a site-meet on March 23, 1994 with public utility locators responding to the USA notification.

- Assisted the Client in obtaining competitive cost estimates from three drilling companies for the installation of two temporary groundwater monitoring wells at the site. The Client contracted directly with the selected drilling contractor for well drilling and installation services.
- Observed the excavation of two exploratory borings at the site. The borings were excavated utilizing an air-rotary drill rig (i.e., Cantera CT-450). The two borings were placed upon the existing easterly-westerly trending ridge (at an approximate elevation of 430 feet MSL) situated south of Poggi Canyon.
- Documented the subsurface soil conditions encountered during the exploratory boring activities. Prepared descriptive logs of the exploratory borings for inclusion in this report.
- Obtained grab soil samples and drive soil samples from within the exploratory borings for possible laboratory testing. The drive soil samples were obtained using a standard penetration test (SPT) split spoon sampler equipped with brass inner rings. The tip of the sampler was advanced into the soil using blows from a 140-pound hammer falling approximately 30 inches. The lead tube was capped with teflon sheeting and plastic end caps, labelled, and placed with ice in an insulated container. Chain of Custody documentation was followed for each soil sample submitted to the laboratory for testing. The grab soil samples were obtained from the drilling cuttings that were evacuated from the boring using compressed air. The grab soil samples were used to assist in classification of lithology and were not subjected to laboratory testing.
- Provided quality assurance/quality control (QA/QC) procedures during the field exploration activities. The drill stem/bits were steam cleaned prior to the excavation of each boring.
- Submitted six soil drive samples collected to a CAL EPA-certified analytical laboratory for testing. Six soil samples were tested for total lead, five soil samples were tested for total copper, and one soil sample was tested for halogenated volatile organic compounds.
- Placed soil excavated from the exploratory boring onto plastic sheeting and covered
 with plastic sheeting for disposal by the Client following regulatory protocol. Soil
 cuttings and waste water generated during the exploration activities are assumed
 hazardous until proven otherwise.

 Observed the completion of the exploratory borings as temporary groundwater monitoring wells. Each well was constructed of 2-inch-diameter polyvinyl chloride (PVC) casing.

Task IV - Limited Groundwater Sampling

- Observed the development of the temporary groundwater monitoring wells. The wells were developed using compressed air.
- Measured the water level, monitored for free-floating product, and purged the temporary groundwater monitoring wells for subsequent sampling of the groundwater. Monitoring Well MW1 (i.e., the perched-aquifer well) was purged by removing a volume of groundwater from the well equivalent to three times the volume of water contained within the casing and saturated well annulus. Monitoring Well MW2 (i.e., the regional unconfined aquifer well) was not purged before sampling. The temperature, pH, and conductivity of the groundwater were monitored during purging. The waste water generated during well development and sampling activities was placed in a 55-gallon drum, labelled, and left onsite for proper disposal by the Client.
- Collected three groundwater samples from Monitoring Well MW1 and one groundwater sample from Monitoring Well MW2. The samples were collected (after 80 percent recovery of the static water level) using a stainless steel or disposable plastic bailer, placed in laboratory-provided glass containers, labeled, placed with ice in an insulated container, and delivered to a California Environmental Protection Agency (CAL EPA)-certified laboratory for testing.
- Provided quality assurance/quality control procedures during the field activities. These procedures include cleansing the sampling equipment prior to each sampling effort by washing in a trisodium phosphate solution followed by successive potable water and deionized water rinses. Chain-of-custody documentation and protocol were implemented for each groundwater sample transferred to the laboratory.
- Submitted the groundwater samples collected to a CAL EPA-certified analytical laboratory for testing for volatile organics following the U.S. Environmental Protection Agency (EPA) Test Method 8240, for semi-volatile organics following EPA Test Method 8270, and for California Code of Regulation (CCR) Title 22 total metals following various test methods.

PREFIELD ACTIVITIES

GEC performed preliminary services prior to the initiation of field activities. These services are described in the Scope of Services section of this report and include the preparation of a Health and Safety Plan, notification to Underground Services Alert (USA), and obtaining permits for the installation of exploratory borings and temporary groundwater monitoring wells.

LIMITED RESEARCH - GEOLOGIC AND GROUNDWATER CONDITIONS

Site Geology

A review of "Geology of National City, Imperial Beach, and Otay Mesa Quadrangles, Southern San Diego Metropolitan Area, California," California Division of Mines and Geology, 1977, indicates that the surficial lithology in the vicinity of the onsite groundwater monitoring wells is mapped as the Tertiary-aged Otay Formation (To). The Otay Formation is described as light-gray and light brown, moderately well-sorted, poorly indurated, massive sandstone and claystone. The sandstone is weakly cemented locally. The claystone is waxy and composed almost exclusively of bentonite. The mapped rock type was confirmed during the field activities. The geologic conditions encountered during exploratory boring activities are depicted on the Boring Logs, Appendix B, and summarized below.

Groundwater Occurrence and Quality

A review of the "Comprehensive Water Quality Control Plan for the San Diego Basin," dated July 1975, and issued by the State Water Resources Board, indicates that the subject site is located

above-referenced document indicates temperature measurements between 69 and 82 degrees Fahrenheit, pH measurements between 6.9 and 8.2, and conductivity measurements between 987 and 4,500 μ mhos for wells situated within the Otay Hydrology Subunit.

VADOSE MONITORING ACTIVITIES

Vadose monitoring activities were performed during two monitoring events conducted on March 28, 1994 and May 9, 1994. A Solonist water level meter was lowered to the total well depth in each of the three temporary vadose monitoring wells (Wells V1, V2, and V3). Liquid was not detected in the wells on either date. The approximate locations of the vadose monitoring wells are depicted on the Site Plan, Figure 2.

SOIL-GAS MONITORING ACTIVITIES

Gas Well Refurbishing

A GEC representative removed the original well heads on the seven existing vadose gas monitoring wells (Wells G1 through G7) at the site in March 1994. The original gas sampling tubes/ports were identified and refurbished. Security well covers (standpipes) set in concrete pads were reinstalled for each gas monitoring well.

Soil-Gas Monitoring

Two iterations of soil-gas monitoring were conducted at the site on April 15 and May 6, 1994. During each iteration, GEC representatives collected a soil-gas sample from each of the twenty sampling probes within the seven existing vadose gas monitoring wells (Wells G1 through G7). A Model 224-PCXR3 SKC Universal Flow Sample Pump was connected with Tygon tubing to the sampling port at the top of each well and pumped for 60 seconds to purge each probe. Gas samples were then extracted from each gas probe using the sampling pump and were collected in Tedlar bags.

The samples were monitored with the MSA Model 361 meter (CGI) for combustible gases, percent oxygen, and hydrogen sulfide. The samples were also monitored for total ionizable compounds using a Century Foxboro Model 128 Organic Vapor Analyzer (OVA) calibrated for response to methane. It should be noted that the OVA provides qualitative measurements for the presence of volatile/gaseous organic compounds, including methane. These measurements are not specific for the detection of methane. The results of the gas screenings are summarized in Tables I and II.

A review of the test results indicates that the soil-gas samples exhibited concentrations of organic vapor from less than the detection limit of the instrument (i.e., approximately 5 parts per million [ppm]) to greater than 1000 ppm (i.e., the maximum calibration limit of the instrument).

The soil-gas sample exhibiting the greatest organic vapor concentration was Sample G6-G, obtained from a screened interval at 35 feet BGS. This sample was submitted to West Coast Analytical Service, Inc. and subjected to testing for methane by a gas chromatograph equipped with a flame ionization detector.

Soil-Gas Laboratory Results

The soil-gas laboratory results are presented in Appendix C. A review of the laboratory results indicates that Soil-Gas Sample G6-G exhibited a methane concentration of 3300 ppm.

EXPLORATORY BORINGS/LIMITED SOIL SAMPLING

Excavation of Exploratory Borings

The exploratory drilling activities were performed between March 23 and April 5, 1994. The drilling activities consisted of the excavation of two (2) exploratory borings (MW1 and MW2). The exploratory borings were extended to depths of approximately 177 feet and 337 feet below the existing ground surface (BGS), respectively. The approximate locations of the borings are depicted on the Site Plan, Figure 2. Descriptive logs of the borings are presented in Appendix B.

The borings were excavated by Tri-County Drilling using a truck-mounted Cantera CT-450 air rotary drill rig. Twenty-six grab soil samples and seven drive soil samples were collected (for potential laboratory analysis) from the exploratory borings following protocol described in the Scope of Services section of this report. The two borings were completed as temporary

groundwater monitoring wells. To prevent intermixing of separate aquifer systems, Monitoring Well MW2 was drilled using an 8-inch diameter bit through the perched aquifer, grouted with a cement-bentonite mixture from through the producing zone of the perched aquifer, then redrilled to a depth of approximately 337 feet BGS using a 6-inch diameter bit. A polymer drilling fluid additive (Poly-Vis) was introduced into the boring during the excavation of Monitoring Well MW2 to assist in keeping the hole from caving and to promote circulation of the drilling cuttings. The material safety data sheet for Poly-Vis is presented in Appendix D.

Soil Conditions Encountered

Soils encountered during the excavation of the exploratory borings consists primarily of the Tertiary-aged Otay, Sweetwater, and Mission Valley Formations.

Otay Formation (To). The Otay Formation was encountered from the ground surface to an approximate depth of 228 feet BGS. The Otay Formation consists primarily of medium dense to dense, damp to moist, light yellowish brown, silty, fine to medium and coarse sandstone, with some clay; and hard, damp to moist, brown to olive brown, fine to medium sandy claystone. A stiff to hard, damp to moist, white to light gray and pink bentonite layer was encountered between the depths of approximately 90 and 100 feet BGS. The lower portion of the Otay Formation is a silty to clayey, fine to coarse sand with gravels, is described as a gritstone and has been included with the Sweetwater Formation in some past descriptions in the literature.

Sweetwater Formation (Tsw). The Sweetwater Formation was encountered between the depths of approximately 228 and 330 feet BGS. The Sweetwater Formation encountered is generally comprised of very moist, dense to very dense, reddish brown, silty claystone with gravels.

Mission Valley Formation (Tmv). The Mission Valley Formation was encountered from the depth of approximately 330 feet BGS to the maximum depth drilled of 337 feet BGS. The Mission Valley Formation encountered is comprised of dense, moist, light yellowish brown, siltstone with traces of very fine sand and clay.

Depth to Groundwater

Two water bearing zones were encountered during the exploratory boring activities. The upper zone is described as a perched water layer and was encountered at depth of approximately 167 feet below top of casing (TOC). Monitoring Well MW1 is screened to intercept this zone. The lower zone encountered is described as the regional unconfined aquifer and was encountered at a depth of approximately 278 feet TOC (275 feet BGS) during the advancement of the borehole in which Monitoring Well MW2 was installed. However, prior to sampling, the water level in this well decreased to approximately 283 feet TOC (280 feet BGS). Monitoring Well MW2 is screened to intercept this zone. The approximate ground surface elevation adjacent to the two monitoring wells, based upon the USGS Imperial Beach, California Quadrangle Topographic Map

(1967), is approximately 440 feet above mean sea level (MSL). The approximate elevations of the upper and lower aquifers encountered are 280 feet MSL and 160 feet MSL, respectively.

Laboratory Results: Soil Samples

Six of the drive soil samples collected were selected for laboratory analysis. Six soil samples were analyzed for total lead following EPA Test Method 6010 and five soil samples were analyzed for total copper following EPA Test Method 6010. Additionally, one soil sample was also analyzed for halogenated volatile organics following EPA Test Method 8010. Copies of the laboratory results and chain of custody documentation for the soil samples are presented in Appendix C and summarized in Table III. The depths at which the samples were collected are denoted on the logs of the exploratory borings, presented as Appendix B.

A review of the laboratory test results indicates that the soil samples analyzed exhibited reported total lead concentrations ranging from 9.6 to 29.1 milligrams per kilogram (mg/kg) and total copper concentrations ranging from 6.2 to 28.4 mg/kg.

A review of the laboratory test results indicates that the soil sample (MW2-4) subjected to analysis by EPA Test Method 8010 did not exhibit reported concentrations of halogenated volatile organic compounds greater than the laboratory detection limits.

GROUNDWATER MONITORING WELLS

Monitoring Well Installation

Pursuant to the Well Permit W93683 approved July 29, 1993, two temporary groundwater monitoring wells were installed within the above-noted exploratory borings on March 27 and April 5, 1994. Copies of the well permit application, permit extension, and well log submittal documents are presented in Appendix A.

The wells were installed to depths of approximately 177 and 332 feet BGS, respectively. Each monitoring well is constructed with 2-inch diameter, threaded flush joint polyvinyl chloride (PVC) casing with a 0.020-inch slotted screen section approximately 15 or 20 feet long. Monitoring Well MW1 is constructed with schedule 40 casing, while Monitoring Well MW2 is constructed with schedule 80 casing. The annular space surrounding the well screen was backfilled with Number 3 Lonestar sand to approximately 2 feet above the top of the well screen. A 2-foot thick layer of bentonite chips, hydrated with tap water, was placed above the sand pack. The remaining annular space above the bentonite chips was backfilled with a bentonite grout mixture pumped downhole through a tremie pipe. A standpipe wellhead cover was provided for each well. The well cover was set in a concrete pad measuring approximately 3 feet square. Descriptive boring/well logs depicting the construction of the wells are presented in Appendix B. The approximate locations of the groundwater monitoring wells are depicted in Figure 2.

Monitoring Well Development

The temporary groundwater monitoring wells were developed by Multi-Well Systems on April 13 and 14, 1994 using compressed air. The well development technique consisted of repeatedly moving a one-inch diameter pipe equipped with an air jet nozzle through the screened section of each well while forcing compressed air through the nozzle. When water production ceased at the top of casing, the system was temporarily shut down and the well was allowed to recover. The process was conducted a minimum of five iterations for each well.

GROUNDWATER MONITORING ACTIVITIES

Groundwater Sampling

Monitoring Well MW1 was sampled prior to well development on March 29, 1994 and subsequent to well development on April 15 and May 6, 1994. Monitoring Well MW2 was sampled on April 19, 1994.

Prior to each sampling event, a GEC representative measured the depth to groundwater and observed for non-aqueous phase petroleum product within each well. Monitoring Well MW1 was purged and groundwater samples were collected following the protocol described in the Scope of Services section of this report. Due to construction limitations, purging was not feasible for Monitoring Well MW2. The well purging and sampling activities are documented on the "Temporary Groundwater Monitoring Well Sampling Worksheet" presented as Appendix E.

Results of Field Measurements

During the Monitoring Well MW1 purging activities, measurements of temperature, pH, and conductivity were obtained from the purge water. The temperature, pH, and conductivity measurements obtained range from 71.9 to 76.0 degrees Fahrenheit, 7.81 to 7.94, and 3,210 to 1,000 mmhos, respectively. The groundwater sample obtained from Monitoring Well MW2 was also tested in the field for temperature, pH, and conductivity. These measurements are 80.2 degrees Fahrenheit, 11.94, and 4930 µmhos, respectively. The temperature and conductivity measurements appear to be similar to those obtained during the purging of Monitoring Well MW1. However, the pH measurement obtained from the groundwater sample collected from Monitoring Well MW1 appears to be elevated compared to the pH measurements obtained during purging of Monitoring Well MW1. Within the exception of the pH measurement obtained from the groundwater sample collected from Monitoring Well MW2, the temperature, pH, and conductivity measurements appear to be consistent with measurements obtained from other groundwater wells in the hydrologic unit of which the site is a part. It is surmised that the elevated pH measurement may be due to the potential presence of grout materials (e.g., cement) used to construct the wells, within the well casing.

The groundwater samples collected during these sampling iterations were subjected to laboratory analysis for CCR Title 22 total metals following various test methods. One sample obtained from Monitoring Well MW1 was additionally tested for volatile organics following EPA Test Method 8240.

June 3, 1994

Free Product Occurrence

The presence of non-aqueous phase petroleum product was not detected in Wells MW1 or MW2

during the groundwater sampling events.

Laboratory Results: Groundwater Samples

Copies of the laboratory results and chain of custody documentation for the groundwater samples

obtained are presented in Appendix C. The results for total metals analysis are summarized in

Table III.

A review of the laboratory test results indicates that the groundwater sample obtained from

Monitoring Well MW1 on March 29 and May 6, 1994 did not exhibit concentrations of volatile

organic compounds or semi-volatile organic compounds greater than the laboratory detection limits

for the various compounds tested, with the exception of an unknown hydrocarbon and an unknown

oxygenated hydrocarbon with concentrations of 8 µg/l each.

A review of the laboratory results for the groundwater samples collected from Monitoring Wells

MW1 and MW2 indicates that detectable concentrations of total metals were reported for the four

samples obtained on March 29, April 15, April 19, and May 6, 1994. The reported metals

concentrations for the samples collected on March 29, April 15, and April 19, 1994 are less than

the Maximum Contaminant Levels (MCLs) for the State of California primary drinking water

standards, and for the secondary drinking water standards, with the exception of Sample MW2-1A

- 17 -

Project No. 08080-06-05 June 3, 1994

collected on April 19, 1994, which exhibited a chromium concentration of 0.14 milligrams per liter (mg/l) and a selenium concentration of 0.012 mg/l and Sample MW-1 collected on May 6, 1994, which exhibited a selenium concentration of 0.011 mg/l. The MCLs for these compounds are 0.05 mg/l (chromium) and 0.01 mg/l (selenium) (see Table III).

SUMMARY OF FINDINGS

Vadose Monitoring

1. Two iterations of vadose monitoring activities were performed for the three existing vadose monitoring wells (Wells V1, V2, and V3). Liquid was not detected in the wells.

Soil-Gas Monitoring

- 2. Two iterations of soil-gas monitoring activities were performed for the seven existing soil-gas monitoring wells (Wells G1 through G7). Detectable concentrations of organic vapors were measured (using a Century Foxboro Model 128 Organic Vapor Analyzer calibrated for methane) in two of the wells. The greatest measured concentration (> 1000 ppm) was reported for the upper sample port (depth of 35 feet BGS) in Well G6 (Sample G6-G).
- 3. The soil-gas sample exhibiting the greatest concentration of organic vapor (Sample G6-G) was subjected to laboratory analysis for methane gas. Sample G6-G exhibited a methane concentration of 3300 ppm.

Limited Soil Sampling

4. A review of laboratory test results for six soil samples obtained from the two exploratory borings advanced at the site indicates that these samples exhibited total lead concentrations ranging

from 9.6 to 29.1 milligrams per kilogram (mg/kg) and total copper concentrations ranging from 6.2 to 28.4 mg/kg.

5. A review of laboratory test results for one soil sample subjected to testing for halogenated volatile organics (following EPA Test Method 8010) obtained during the onsite exploratory boring activities did not exhibit reported concentrations of halogenated volatile organic compounds greater than the laboratory detection limits.

Limited Groundwater Sampling

- 6. A review of laboratory test results indicates that the groundwater samples obtained from Monitoring Well MW1 on March 29, and May 6, 1994 did not exhibit concentrations of volatile organic compounds (following EPA Test Method 8240) or semi-volatile organic compounds (following EPA Test Method 8270) greater than the laboratory detection limits for the various compounds tested.
- 7. A review of the laboratory test results for the groundwater samples collected from Monitoring Wells MW1 and MW2 indicates that detectable concentrations of CCR Title 22 total metals were reported for the four samples obtained on March 29, April 15, April 19, and May 6, 1994. The reported metals concentrations for these samples are less than the Maximum Contaminant Levels (MCLs) for the State of California primary drinking water standards, and less than the California secondary drinking water standard with the exception of Sample MW2-1A

Project No. 08080-06-05 June 3, 1994

collected on April 19, 1994, which exhibited a chromium concentration of 0.14 milligrams per liter (mg/l) and a selenium concentration of 0.012 mg/l and Sample MW-1 collected on May 6, 1994, which exhibited a selenium concentration of 0.011 mg/l. The MCLs for these compounds are 0.05 mg/l (chromium) and 0.01 mg/l (selenium).

CONCLUSIONS AND RECOMMENDATIONS

- 1. The results of the limited environmental engineering activities performed during the preparation of this report do not indicate the presence of the compounds surveyed within the soils or groundwater beneath the subject site at concentrations likely to require action by the local regulatory agencies (i.e., SAM Division and RWQCB).
- 2. It is recommended that two to three additional temporary groundwater monitoring wells be installed at the site to obtain additional information regarding the potential presence of hazardous materials beneath the site.
- 3. It is recommended that the existing and proposed temporary groundwater monitoring wells be monitored on a quarterly basis for the presence of hazardous compounds for the period of at least one year.
- 4. It is recommended that at least one of the proposed groundwater monitoring wells be situated downgradient of the known fault situated on the Otay Landfill property.

REPORT LIMITATIONS

This report has been prepared exclusively for the Client (Portfolio Investments Limited). Information obtained is only relevant as of the date of this report. The Client should recognize that this report is not a comprehensive site characterization and should not be construed as such. The findings and conclusions in this report are predicated on the results of limited soil sampling and laboratory analysis. The absence of significant indicators which suggest that hazardous materials/wastes have impacted the site does not preclude the presence of hazardous materials/wastes on the property.

Therefore, the report should only be deemed conclusive with respect to the information obtained. No guarantee of the results of the study is implied within the intent of this report. GEC strived to perform the services rendered in accordance with the local standard of care in the geographic region at the time the services were rendered.

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OF DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT. Purchaser accepts this Report "AS IS". Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

Copyright 2019 by Environmental Data Resources, Inc. All rights reserved. Reproduction in any media or format, in whole or in part, of any report or map of Environmental Data Resources, Inc., or its affiliates, is prohibited without prior written permission.

EDR and its logos (including Sanborn and Sanborn Map) are trademarks of Environmental Data Resources, Inc. or its affiliates. All other trademarks used herein are the property of their respective owners.

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the target property or within the search radius around the target property for the following databases:

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in **bold italics** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS list

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 10/25/2019 has revealed that there is 1 SEMS

site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
A&W SMELTER AND REFI	SILVER QUEEN RD	SSE 1/4 - 1/2 (0.360 mi.)	A7	118

Site ID: 0904755 EPA Id: CAD982416604

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 10/25/2019 has revealed that there is 1 SEMS-ARCHIVE site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
APPROPRIATE TECHNOLO Site ID: 0902662	1700 MAXWELL RD	SSE 1/4 - 1/2 (0.360 mi.)	A6	76
EPA Id: CAT080010101				

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 12/16/2019 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
APPROPRIATE TECHNOLO	1700 MAXWELL RD	SSE 1/4 - 1/2 (0.360 mi.)	A6	76
EPA ID:: CAT080010101				

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA)

of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 12/16/2019 has revealed that there is 1 RCRA-TSDF site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
APPROPRIATE TECHNOLO	1700 MAXWELL RD	SSE 1/4 - 1/2 (0.360 mi.)	A6	<i>7</i> 6
FPA ID:: CAT080010101				

Federal RCRA generators list

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/16/2019 has revealed that there is 1 RCRA-SQG site within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

CA ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the CA ENVIROSTOR list, as provided by EDR, and dated 07/29/2019 has revealed that there are 7 CA ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

Facility Id: 37200001

CA SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the CA SWF/LF list, as provided by EDR, has revealed that there are 3 CA SWF/LF sites within approximately 0.5 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Landfill / Solid Waste Disposal Sites

CA WMUDS/SWAT: The Waste Management Unit Database System is used for program tracking and inventory of waste management units. The source is the State Water Resources Control Board.

A review of the CA WMUDS/SWAT list, as provided by EDR, and dated 04/01/2000 has revealed that there is 1 CA WMUDS/SWAT site within approximately 0.5 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 12/16/2019 has revealed that there are 2 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

Region: 9

Facility Type: Solid Waste Site-Class I - A solid waste facility at which hazardous

waste may be treated or stored.

Facility Description: Not reported Facility Telephone: Not reported

SWAT Facility Name: OMAR RENDERING COMPANY

Primary SIC: 21

Secondary SIC: Not reported
Comments: Not reported
Last Facility Editors: Not reported

Waste Discharge System: True

Solid Waste Assessment Test Program: True
Toxic Pits Cleanup Act Program: False
Resource Conservation Recovery Act: False
Department of Defence: False

Solid Waste Assessment Test Program: OMAR RENDERING COMPANY

Threat to Water Quality: Major Threat to Water Quality. A violation could render unusable a

ground water or surface water resource used as a significant drink water supply, require closure of an area used for contact recreation, result in long-term deleterious effects on shell fish spawning or growth areas of aquatic resources, or directly expose the public to

toxic substances.

RB Case Number: 2091200
LOC Case Number: H02426-003
File Location: Regional Board

Potential Media Affect: Aquifer used for drinking water supply, Soil

EDR Link ID: L10003156547

Potential Contaminants of Concern: * Acids/Corrosives, Arsenic, * Chlorinated Hydrocarbons, Waste Oil /

Motor / Hydraulic / Lubricating, Other Petroleum

Site History: The Omar Rendering site is situated on 40 acres enclosed by a

chain-link and wood fence. The facility accepted hazardous wastes from 1959 to 1978 and utilized evaporation ponds for disposal. Prior to 1980, the contents of six former Class I waste ponds were removed and disposed at a permitted off site location. In 1981, the impacted soil from beneath the Class I waste ponds was placed in a lined and capped waste cell in the northwest corner of the site, in accordance with RWQCB Order No. 80-06 (Closure Requirements for the Omar Rendering Company Dumpsite in the Otay River Valley). Subsequently, the waste cell has been maintained and monitored per RWQCB Order No. 87-141, [Waste Discharge Requirements (WDRs) for the Omar Rendering Company Closed Class I Disposal Site including Technical Change Order No. 1 Monitoring and Reporting Program], which was replaced by RWQCB Order No. 97-Annual/Semi-Annual Report April 2010 Former Omar Rendering Site 2 40 (Waste Discharge Requirements for Closure and Post-Closure Maintenance for the Class I Waste Management Containment Cell, Omar Rendering Facility, Darling International, which includes Monitoring and Reporting Program 97-40). Program No. 97-40 requires semi-annual groundwater monitoring and periodic monitoring and maintenance of the cap and surface water control features. The waste cell has the following physical properties: h Approximate waste cell area: 5 acres. h Stratigraphy, approximate depth below grade (City of Chula Vista Engineering Department, Samual F. Savino PE, As-built grading plan, sheet 4 of 7, Sections A-A and B-B, dated 10-27-82). 0-6 ft: clean soil cover 6-9 ft: compacted clay cap 9-53 ft: compacted soil waste There is currently no documented human health exposure. 53-56 ft: compacted clay liner (base is at approx. elev. of 155 feet mean sea level [MSL]) h The bottom of the waste cell is greater than 25 feet above the groundwater table (the water table is encountered at an elevation of 120 to 130 feet MSL in the vicinity of the waste cell). h Clay material used for liners was analyzed and determined to have a permeability of less than 1E-06 centimeters per second (cm/sec), and compacted to 90 percent relative compaction (Geocon, Testing and Observation Services During Grading Operations,

Map ID MAP FINDINGS
Direction

Distance Elevation

ation Site Database(s) EPA ID Number

OMAR RENDERING LANDFILL (Continued)

S100833528

EDR ID Number

dated January 1982). h The material placed in the waste cell was primarily impacted soil excavated from beneath the former Class I ponds and rendering waste ponds (pond contents were removed off site); consequently, the material is assumed to have a low organic content, and have low potential for generating methane gas. h The waste cell contents were compacted to at least 90 percent relative compaction (Geocon, January 1982). San Diego Water Board issued cleanup and abatement Order R9-2003-0080 and addendum no. 1 to that Order for cleanup and abatement of areas of the site impacted by pollutants from the former waste disposal pits located on site. The monitoring and maintenance of the Omar Landfill are covered by WDRs Order 97-40 (and addenda thereto) and a detection monitoring program issued under authority of Water Code section 13263, and the landfill is not part of the cleanup being conducted under the CAO.

Click here to access the California GeoTracker records for this facility:

CA BOND EXP. PLAN:

Reponsible Party: BACKLOG SITE CLEANUP PLANNING REPORT

Project Revenue Source Company: Not reported Project Revenue Source Addr: Not reported Project Revenue Source City,St,Zip: Not reported

Project Revenue Source Desc: This site is projected to be remediated by responsible parties with

reimbursement to DHS for its oversight/monitoring costs. However, if the responsible parties are unable to pay for site cleanup, another source of funds

will need to be established.

Site Description: This site is situated on 40 acres and is enclosed by chain link and wood

fencing. The facility accepted hazardous wastes from 1959 to 1978 and utilized evaporation ponds for disposal. These ponds were excavated upon closure and the

residues were left onsite.

Hazardous Waste Desc: Chemicals disposed of onsite include petroleum hydrocarbons, acids, caustic

solutions, and heavy metals. Soil samples indicate the presence of copper, chromium, nickel, lead, 1,1-dichloroethane, cadmium, dichlorodiphenyl, trichloroethane (TCA), aldrin, and polychlorinated biphenyls (PCBs).

Threat To Public Health & Env: The public may be exposed to contaminated dust and/or volatile organic

compounds if soil is disturbed. Ground water contamination could occur if the pond residuals are released from the disposal cell. Chronic exposures could occur if contaminated soils are left exposed after construction. There is no

documented exposure at this time.

Site Activity Status: The potential responsible party conducted a site assessment in Summer, 1988 to

determine the location and concentrations of contaminants onsite and the potential to migrate off the property. DHS will evaluate the findings of the assessment to determine a priority for scheduling the site in future Bond

Expenditure Plans.

EDR ID Number Elevation Site **EPA ID Number** Database(s)

APACHE SERVICES (Continued)

S100833516

Project Revenue Source City, St, Zip: Not reported

Project Revenue Source Desc: This site is projected to be remediated by the responsible parties will

reimbursement to DHS for its oversight activities. If the RPs are unable to fund site cleanup, another source of funds will need to be identified.

Site Description: The site was formerly a junkyard. Many of the wastes onsite are thought to be

associated with nearby naval facilities.

Hazardous Waste Desc: Soil contamination includes low levels of copper, zinc, cadmium and lead.

Hazardous wastes previously stored and spilled include petroleum distillates, solvents, electrical insulating oils, trichloroethane (TCA), chloroform, and

perchloroethylene (PCE). The site is located on fill material.

Threat To Public Health & Env: There is some potential threat to the Otay River. Farmland is adjacent to the

site. PCE and TCA were found in standing surface water and ground water. Ground

water is within 12 feet of the surface. The site has been partially abated through removal of the most highly contaminated soil. This site will be further evaluated in the future to determine if additional cleanup action is necessary.

Site Activity Status: In February, 1981, a cleanup and abatement order was issued by the RWQCB, San

Diego Region. DHS was working in coordination with the U.S. Navy, a potentially responsible party, when the salvage yard was destroyed by fire in August, 1985. Some subsequent surface removal occurred. There has been inadequate chatacterization to determine the current levels of contamination. Additional site characterization is necessary to confirm the adequacy of cleanup. The responsible parties are continuing remediation work under the oversight of the

San Diego RWQCB.

NO SITES FOUND

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

SCRD DRYCLEANERS: State Coalition for Remediation of Drycleaners Listing

The State Coalition for Remediation of Drycleaners was established in 1998, with support from the U.S. EPA Office of Superfund Remediation and Technology Innovation. It is comprised of representatives of states with established drycleaner remediation programs. Currently the member states are Alabama, Connecticut, Florida, Illinois, Kansas, Minnesota, Missouri, North Carolina, Oregon, South Carolina, Tennessee, Texas, and Wisconsin.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing

Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

LOS ANGELES CO LF METHANE: Methane Producing Landfills

This data was created on April 30, 2012 to represent known disposal sites in Los Angeles County that may produce and emanate methane gas. The shapefile contains disposal sites within Los Angeles County that once accepted degradable refuse material. Information used to create this data was extracted from a landfill survey performed by County Engineers (Major Waste System Map, 1973) as well as historical records from CalRecycle, Regional Water Quality Control Board, and Los Angeles County Department of Public Health

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

- 1. Groundwater flow direction, and
- 2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

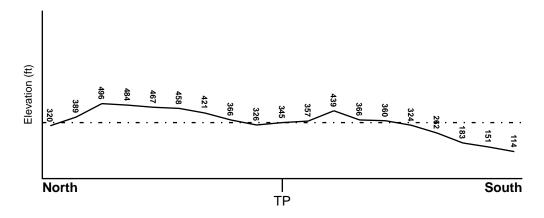

TOPOGRAPHIC INFORMATION

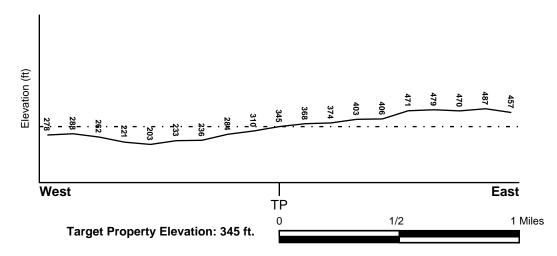

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General WNW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property FEMA Source Type

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property Data Coverage

IMPERIAL BEACH
YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius: 1.25 miles Location Relative to TP: 1/2 - 1 Mile South

Site Name: APPROPRIATE TECHNOLOGIES II

Site EPA ID Number: CAT080010101

Groundwater Flow Direction: W TOWARD SAN DIEGO BAY.

Inferred Depth to Water: 110 to 180 feet.

Hydraulic Connection: Information is not available regarding the hydraulic connection

between aquifer(s) underlying the site.

Sole Source Aquifer: No information about a sole source aquifer is available
Data Quality: Information is inferred in the CERCLIS investigation report(s)

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

LOCATION GENERAL DIRECTION
MAP ID FROM TP GROUNDWATER FLOW

GEOCHECK[®] - PHYSICAL SETTING SOURCE SUMMARY

	LOCATION	GENERAL DIRECTION
MAP ID	FROM TP	GROUNDWATER FLOW
1	1/2 - 1 Mile SSW	Varies

16 1/2 - 1 Mile SSW Varies
1G 1/2 - 1 Mile SSW Varies

For additional site information, refer to Physical Setting Source Map Findings.

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: DIABLO

Soil Surface Texture: clay

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high

water table, or are shallow to an impervious layer.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Bou	ındary		Classi	fication	Saturated hydraulic	
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	conductivity micro m/sec	
1	0 inches	14 inches	clay	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	Not reported	Max: Min:	Max: Min:
2	14 inches	27 inches	clay	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	Not reported	Max: Min:	Max: Min:
3	27 inches	31 inches	weathered bedrock	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	Not reported	Max: Min:	Max: Min:

Soil Map ID: 2

Soil Component Name: DIABLO

Soil Surface Texture: clay

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high

water table, or are shallow to an impervious layer.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Bou	ındary		Classi	fication	Saturated hydraulic	
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	conductivity micro m/sec

3	31 inches	35 inches	weathered bedrock	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	Not reported	Max: Min:	Max: Min:

Soil Map ID: 3

Soil Component Name: SALINAS

Soil Surface Texture: clay loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep,

moderately well and well drained soils with moderately coarse

textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Bou	ındary		Classi	fication	Saturated hydraulic	
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	conductivity micro m/sec	
1	0 inches	22 inches	clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 4 Min: 1.4	Max: 8.4 Min: 7.9
2	22 inches	46 inches	clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 4 Min: 1.4	Max: 8.4 Min: 7.9

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)

Source: United States Geologic Survey

EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.

Source: FEMA

Telephone: 877-336-2627

Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory Source: Department of Fish and Wildlife

Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System

Source: EDR proprietary database of groundwater flow information

EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

Telephone: 800-672-5559

SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

Chula Vista, CA 91911
EDR Inquiry # 5914677.3

GeoSyntec Consultants 16644 West Bernardo Drive SUITE 301 SAN DIEGO, CA 92127

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by GeoSyntec Consultants were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

Contact: Rosemary Propst

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

Certification # 35DE-4144-9370

PO# NA

Project Lennar Sunbow Chula Vista

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

Sanborn® Library search results

Certification #: 35DE-4144-9370

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

Library of Congress

University Publications of America

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available city directory data at 5 year intervals.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. A check mark indicates where information was identified in the source and provided in this report.

APPENDIX H Site Photographs

GEOSYNTEC CONSULTANTS

Geosyntec^D consultants **Photographic Record**

Client: Lennar **Project Number: SC1029**

Site Name: Sunbow - Olympic Parkway, Chula Vista, California

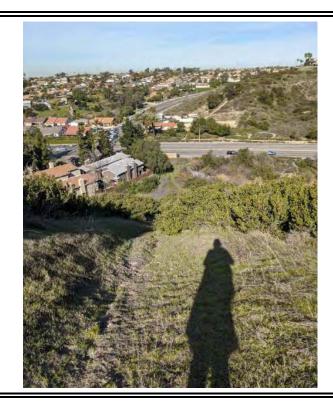

Site Location: Chula Vista, CA

Photograph ID: 1

Date: 1/3/2020

Direction: North

Comments: View of western boundary of Site from the southwestern corner of the Site. Below is Olympic Parkway, beyond which are residential subdivisions.

Photograph ID: 2

Date: 1/3/2020

Direction: Northwest

Comments: View of the adjoining property to the west, which slopes sharply down to Brandywine Avenue, beyond which are residential subdivisions. What appear to be homeless encampments were observed in the western portion of this adjoining property.

Geosyntec consultants

Client: Lennar Project Number: SC1029

Site Name: Sunbow - Olympic Parkway, Chula Vista, California

Site Location: Chula Vista, CA

Photograph ID: 3

Date: 1/3/2020

Direction: Southwest

Comments: View of adjoining residences to the southwest of the

property.

Photograph ID: 4

Date: 1/3/2020

Direction: South

Comments: View of one of the three water towers owned by the Otay Water District on the property adjoining the Site to the south.

Geosyntec consultants

Client: Lennar Project Number: SC1029

Site Name: Sunbow - Olympic Parkway, Chula Vista, California

Site Location: Chula Vista, CA

Photograph ID: 5

Date: 1/3/2020

Direction: North

Comments: View from the southern boundary of the Site to the north. The Site is heavily vegetated in many interior portions of the Property.

Photograph ID: 6

Date: 1/3/2020

Direction: Southwest

Comments: View of the fence line delineating the Site from the adjoining property to the South.

Geosyntec consultants

Client: Lennar Project Number: SC1029

Site Name: Sunbow - Olympic Parkway, Chula Vista, California

Site Location: Chula Vista, CA

Photograph ID: 7

Date: 1/3/2020

Direction: South

Comments: View of a monument that appears to be part of the reclaimed water line within the Site as indicated by the Owner (red, right). A location of one of the existing subsurface monitoring points is indicated by the "CP Test" marker.

Photograph ID: 8

Date: 1/3/2020

Direction: Southeast

Comments: View of the southeastern portion of the Site from the southern boundary. An unimproved dirt path runs along part of the southern boundary but is eroded in several parts. Beyond the fence line is the active Otay Class III landfill.

Geosyntec consultants

Client: Lennar Project Number: SC1029

Site Name: Sunbow - Olympic Parkway, Chula Vista, California

Site Location: Chula Vista, CA

Photograph ID: 9

Date: 1/3/2020

Direction: West

Comments: Pictured is a monitoring point vault containing a monitoring well or soil gas probe. No monitoring point label was able to be located. The vault was not able to be accessed as it was locked with a rusted lock.

Photograph ID: 10

Date: 1/3/2020

Direction: Southwest

Comments: Pictured is a monitoring point vault containing a monitoring well or soil gas probe. No monitoring point label was able to be located. The vault was not able to be accessed as it was locked with a rusted lock.

Geosyntec consultants

Client: Lennar Project Number: SC1029

Site Name: Sunbow - Olympic Parkway, Chula Vista, California

Site Location: Chula Vista, CA

Photograph ID: 11

Date: 1/3/2020

Direction: Northeast

Comments: View of the eastern boundary of the Site and the western boundary of the landfill property. An unimproved dirt path runs around the corner of the Site and continues north along this eastern boundary.

Photograph ID: 12

Date: 1/3/2020

Direction: Southeast

Comments: View of perimeter monitoring probe for the adjacent landfill. This probe appears to correspond with the location of GP-11 or GP-12 based on the Perimeter Probe Map (SCS Engineers, 2019)

Geosyntec consultants

Client: Lennar Project Number: SC1029

Site Name: Sunbow - Olympic Parkway, Chula Vista, California

Site Location: Chula Vista, CA

Photograph ID: 13

Date: 1/3/2020

Direction: West

Comments: View west from the eastern boundary of the Site. The Site is heavily vegetated with grass approximately one to four feet tall, and small shrubs and trees.

Photograph ID: 14

Date: 1/3/2020

Direction: Northwest

Comments: View of the northern portion of the Site containing the permitted wetland. A concrete-lined drainage ditch runs for a portion of the northern perimeter south of the wetland and empties into the wetland (shown in lower left-hand corner of the photo). The road pictured is Olympic Parkway, and residential subdivisions farther north.

Geosyntec consultants

Client: Lennar Project Number: SC1029

Site Name: Sunbow - Olympic Parkway, Chula Vista, California

Site Location: Chula Vista, CA

Photograph ID: 15

Date: 1/3/2020

Direction: West

Comments: Pictured are a locked vault and manhole related to the recycled water easement owned by the Otay Water District that traverses the Site.

Photograph ID: 16

Date: 1/3/2020

Direction: South

Comments: Pictured is a discarded mattress that was observed on the grass over the culvert in the center of the northern perimeter of the Site (access point from Olympic

Parkway).

Geosyntec consultants

Client: Lennar Project Number: SC1029

Site Name: Sunbow - Olympic Parkway, Chula Vista, California

Site Location: Chula Vista, CA

Photograph ID: 17

Date: 1/3/2020

Direction: West

Comments: Pictured is a vault and stake labeled "CP Test" related to an onsite monitoring feature.

Photograph ID: 18

Date: 1/3/2020

Direction: East

Comments: Pictured is the upstream side of one of the culverts present along the northern boundary of the Site. This waterway in the northern portion of the Site was heavily vegetated and water was flowing at the time of the Site visit.

Geosyntec consultants

Client: Lennar Project Number: SC1029

Site Name: Sunbow - Olympic Parkway, Chula Vista, California

Site Location: Chula Vista, CA

Photograph ID: 19

Date: 1/3/2020

Direction: West

Comments: Pictured is an electrical transformer between the northeastern corner of the Site and the sidewalk that runs outside the northern perimeter of the Site. No spills or staining were observed around the transformer, and no PCB stickers were observed.

Photograph ID: 20

Date: 1/3/2020

Direction: West

Comments: Pictured is the label on the transformer described in Photo 19.

Geosyntec consultants

Client: Lennar Project Number: SC1029

Site Name: Sunbow - Olympic Parkway, Chula Vista, California

Site Location: Chula Vista, CA

Photograph ID: 21

Date: 1/3/2020

Direction: West

Comments: View of homes adjoining the Site to the west along

Brandywine Avenue.
