1 Introduction and Background

This technical noise report evaluates the potential noise impacts during construction and operation of the proposed Sunbow II, Phase 3 Project (proposed project). This assessment utilizes the significance thresholds in Appendix G of the California Environmental Quality Act (CEQA) Guidelines (14 CCR 15000 et seq.).

1.1 Project Description

The proposed Project consists of the development of 718 multi-family units on 135.7 acres located in the City of Chula Vista (City), California. The Project site is located south of Olympic Parkway, between Brandywine Avenue and Heritage Road (Figure 1, Project Location). The Proposed Project includes four unique multi-family attached residential product types with 15 unique floorplans, ranging in square footage from approximately 1,100 to 2,050 in two- and three-story units (Figure 2, Site Plan).

The analysis conducted herein assumes 720 multi-family units (two more than currently proposed), consistent with the project's traffic analysis. Therefore, this quantitative analysis is conservative as it assumes two additional dwelling units.

1.2 Noise Characteristics

Sound is mechanical energy transmitted by pressure waves in a compressible medium, such as air. Noise is defined as sound that is loud, unpleasant, unexpected, or undesired. The sound pressure level (SPL) has become the most common descriptor used to characterize the loudness of an ambient sound level. The unit of measurement of sound pressure is a decibel (dB). Under controlled conditions in an acoustics laboratory, the trained, healthy human ear is able to discern changes in sound levels of 1 dB when exposed to steady, single-frequency signals in the mid-frequency range. Outside such controlled conditions, the trained ear can detect changes of 2 dB in normal environmental noise. It is widely accepted that the average healthy ear, however, can barely perceive noise level changes of 3 dB. A change of 5 dB is readily perceptible, and a change of 10 dB is perceived as twice or half as loud (Caltrans 2013a). A doubling of sound energy results in a 3 dB increase in sound, which means that a doubling of sound energy (e.g., doubling the number of daily trips along a given road) would result in a barely perceptible change in sound level.

Sound may be described in terms of level or amplitude (measured in dB), frequency or pitch (measured in hertz or cycles per second), and duration (measured in seconds or minutes). Because the human ear is not equally sensitive to sound at all frequencies, a special frequency-dependent rating scale is used to relate noise to human sensitivity. The A-weighted decibel (dBA) scale performs this compensation by discriminating against low and very high frequencies in a manner approximating the sensitivity of the human ear.

Several descriptors of noise (a.k.a., noise metrics) exist to help predict average community reactions to the adverse effects of environmental noise, including traffic-generated noise. These descriptors include the equivalent noise level over a given period (L_{eq}), the day-night average noise level (L_{dn}), and the community noise equivalent level (CNEL). Each of these descriptors uses units of dBA.

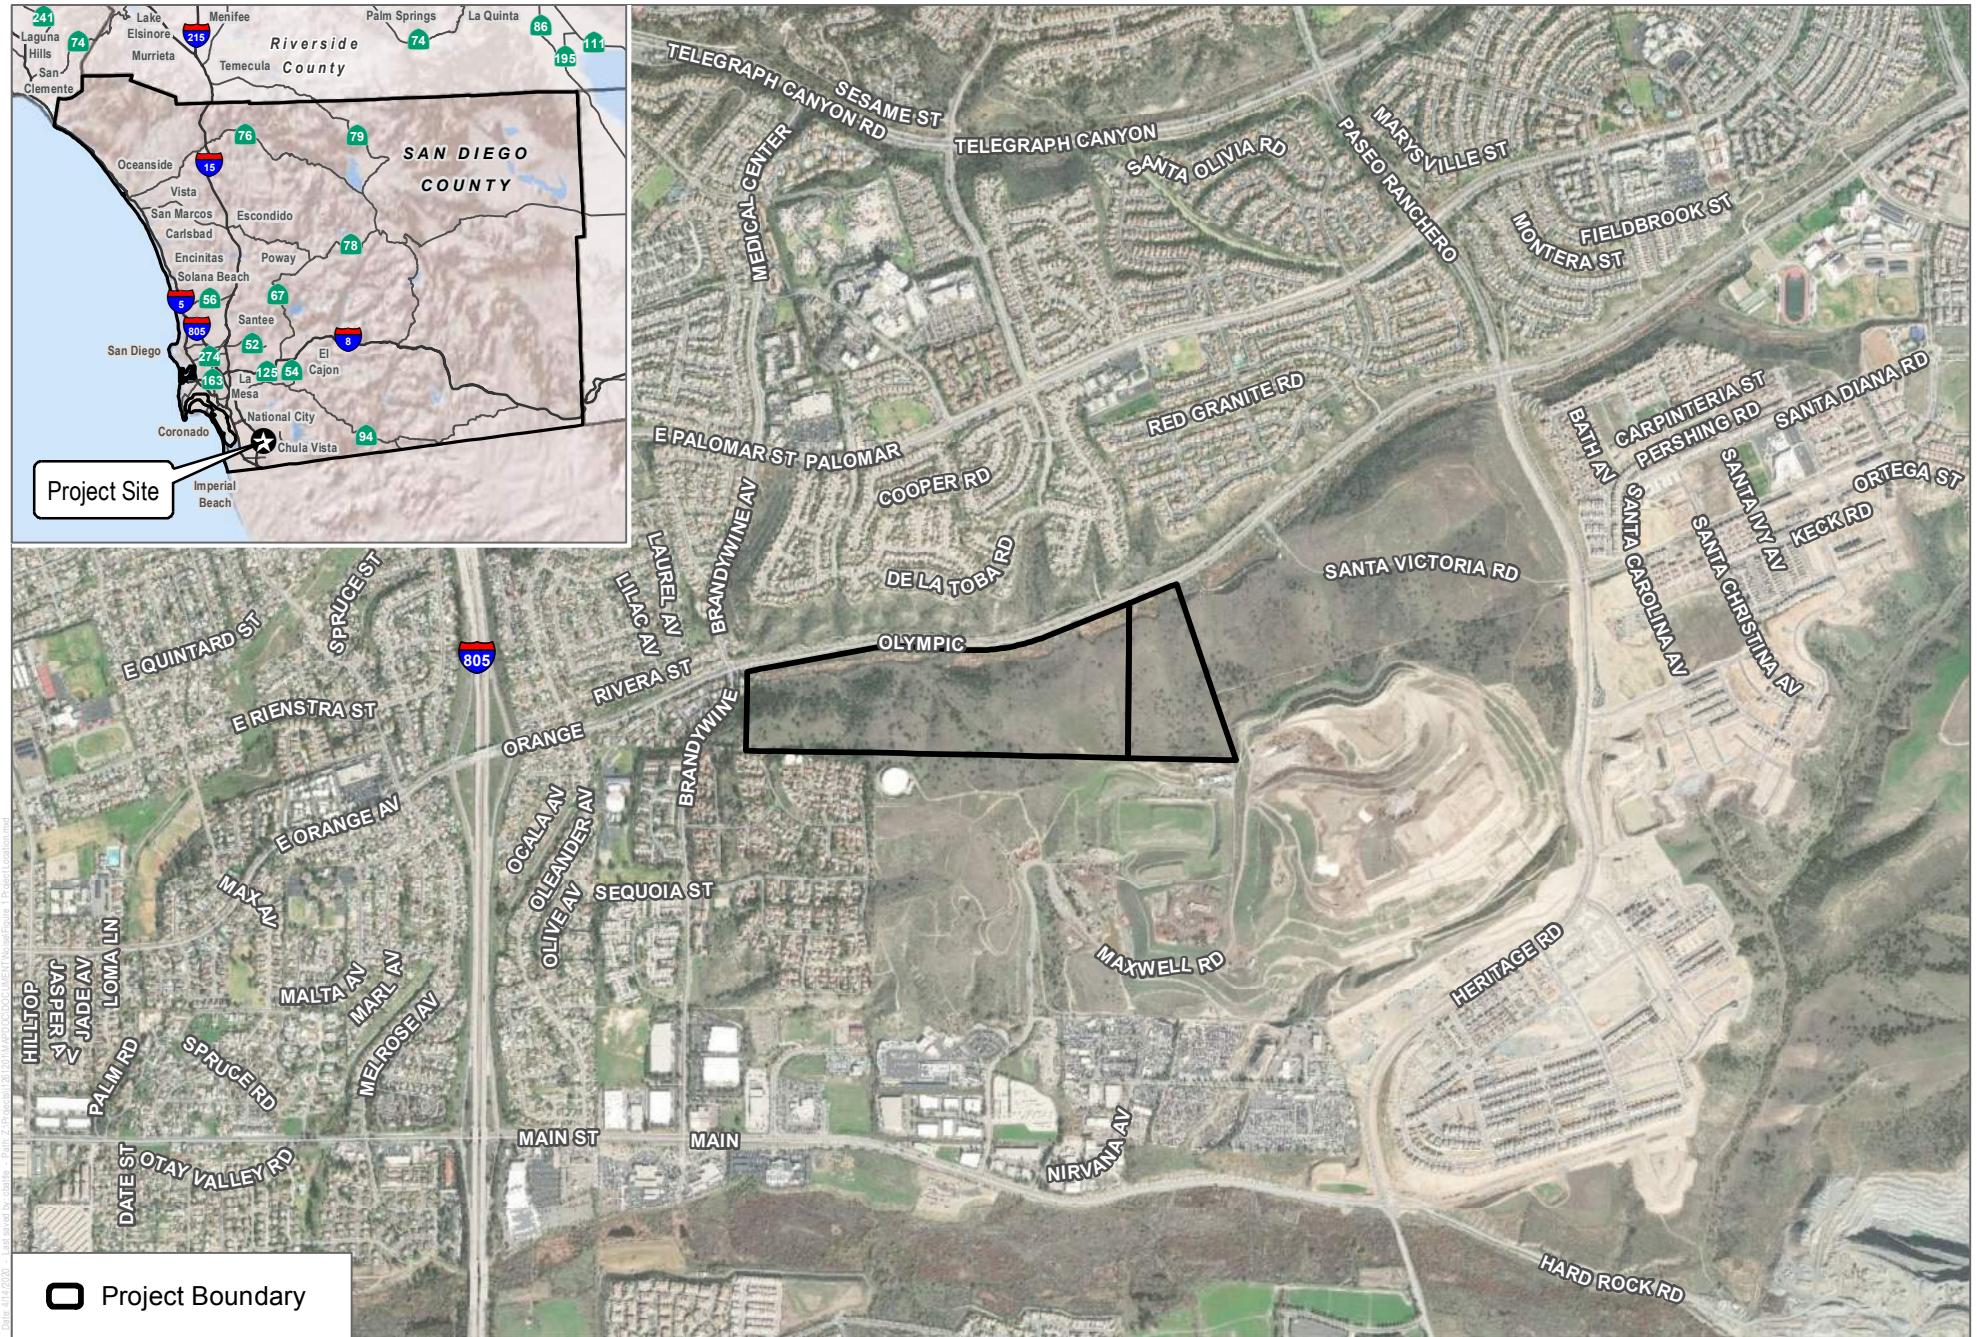

L_{eq} is a decibel quantity that represents the constant or energy-averaged value equivalent to the amount of variable sound energy received by a receptor during a time interval. For example, a 1-hour L_{eq} measurement of 60 dBA would represent the average amount of energy contained in all the noise that occurred in that hour. L_{eq} is an effective noise descriptor because of its ability to assess the total time-varying effects of noise on sensitive receptors, which can then be compared to an established L_{eq} standard or threshold of the same duration. Another

descriptor is maximum sound level (L_{max}), which is the greatest sound level measured during a designated time interval or event. The minimum sound level (L_{min}) is often called the *floor* of a measurement period.

Unlike the L_{eq} , L_{max} , and L_{min} metrics, L_{dn} and CNEL descriptors always represent 24-hour periods and differ from a 24-hour L_{eq} value because they apply a time-weighted factor designed to emphasize noise events that occur during the non-daytime hours (when speech and sleep disturbance is of more concern). *Time weighted* refers to the fact that L_{dn} and CNEL penalize noise that occurs during certain sensitive periods. In the case of CNEL, noise occurring during the daytime (7:00 a.m. to 7:00 p.m.) receives no penalty. Noise during the evening (7:00 p.m. to 10:00 p.m.) is penalized by adding 5 dB to the actual levels, and nighttime (10:00 p.m. to 7:00 a.m.) noise is penalized by adding 10 dB to the actual levels. L_{dn} differs from CNEL in that the daytime period is longer (defined instead as 7:00 a.m. to 10:00 p.m.), thus eliminating the dB adjustment for the evening period. L_{dn} and CNEL are the predominant criteria used to measure roadway noise affecting residential receptors. These two metrics generally differ from one another by no more than 0.5–1 dB, and are often considered or actually defined as being essentially equivalent by many jurisdictions.

1.3 Vibration Fundamentals

Vibration is oscillatory movement of mass (typically a solid) over time. It is described in terms of frequency and amplitude and, unlike sound, can be expressed as displacement, velocity, or acceleration. For environmental studies, vibration is often studied as a velocity that, akin to the discussion of sound pressure levels, can also be expressed in dB as a way to cast a large range of quantities into a more convenient scale and with respect to a reference quantity. Vibration impacts to buildings are generally discussed in terms of inches per second (ips) peak particle velocity (PPV), which will be used herein to discuss vibration levels for ease of reading and comparison with relevant standards. Vibration can also be annoying and thereby impact occupants of structures, and vibration of sufficient amplitude can disrupt sensitive equipment and processes (Caltrans 2013b), such as those involving the use of electron microscopes and lithography equipment. Common sources of vibration within communities include construction activities and railroads. Groundborne vibration generated by construction projects is usually highest during pile driving, rock blasting, soil compacting, jack hammering, and demolition-related activities where sudden releases of subterranean energy or powerful impacts of tools on hard materials occur. Depending on their distances to a sensitive receptor, operation of large bulldozers, graders, loaded dump trucks, or other heavy construction equipment and vehicles on a construction site also have the potential to cause high vibration amplitudes.

2 Regulatory Setting

2.1 Federal

Federal Transit Administration

In its Transit Noise and Vibration Impact Assessment guidance manual, the Federal Transit Administration (FTA) recommends a daytime construction noise level threshold of 80 dBA L_{eq} over an 8-hour period (FTA 2018) when detailed construction noise assessments are performed to evaluate potential impacts to community residences surrounding a project. Although this FTA guidance is not a regulation, it can serve as a quantified standard in the absence of such noise limits at the state and local jurisdictional levels.

2.2 State

California Code of Regulations, Title 24

Title 24 of the California Code of Regulations sets standards that new development in California must meet. According to Title 24, interior noise levels are not to exceed 45 dBA CNEL in any habitable room (ICC 2019).

California Department of Health Services Guidelines

The California Department of Health Services has developed guidelines of community noise acceptability for use by local agencies (OPR 2017). Selected relevant levels are listed here:

- Below 60 dBA CNEL: normally acceptable for low-density residential use
- 50 to 70 dBA: conditionally acceptable for low-density residential use
- Below 65 dBA CNEL: normally acceptable for high-density residential use and transient lodging
- 60 to 70 dBA CNEL: conditionally acceptable for high-density residential, transient lodging, churches, educational, and medical facilities

The normally acceptable exterior noise level for high-density residential use is up to 65 dBA CNEL. Additionally, this exterior noise level limit is consistent with the City of Chula Vista General Plan Noise Element, which considers multi-family units noise-sensitive land uses.

California Department of Transportation

In its Transportation and Construction Vibration Guidance Manual (Caltrans 2013b), the California Department of Transportation (Caltrans) recommends 0.5 ips PPV as a threshold for the avoidance of structural damage to typical newer residential buildings exposed to continuous or frequent intermittent sources of groundborne vibration. For transient vibration events, such as blasting, the damage risk threshold would be 1.0 ips PPV (Caltrans 2013b) at the same type of newer residential structures. For older structures, these guidance thresholds would be more stringent: 0.3 ips PPV for continuous/intermittent vibration sources, and 0.5 ips PPV for transient vibration events. With respect to human annoyance, Caltrans guidance indicates that building occupants exposed to continuous groundborne vibration in the range of 0.2-0.6 ips PPV would find it “unpleasant or “annoying” and thus a likely significant impact. Although these Caltrans guidance thresholds are not regulations, they can serve as quantified standards in the absence of such limits at the local jurisdictional level.

2.3 Local

The following are summarized or reproduced portions of relevant City regulations and General Plan policies.

City of Chula Vista Municipal Code 19.68 (Noise Ordinance)

The City of Chula Vista Noise Ordinance (Chula Vista Municipal Code [CVMC] Section 19.68) (City of Chula Vista 2020) contains regulations restricting land use related noise-generating activities and operations, so as to avoid noise nuisance in the community. Section 19.68.030 of the CVMC establishes the maximum allowable exterior noise limits, based upon the classification of the receiving land use. These standards typically apply to stationary sources such as noise from mechanical equipment (including mechanical ventilation and air condition noise, pool pump noise, etc.) or event noise, as opposed to traffic noise. For instance, a school, commercial enterprise, or industrial operation must not generate noise that exceeds a certain specified noise level at any property boundary where an adjacent residential use exists. The property-line noise standards are presented in Table 1.

Table 1. City of Chula Vista Exterior Property-Line Noise Limits

Receiving Land Use Category	Noise Level (dB(A))	
	10 p.m. to 7 a.m. (Weekdays)	7 a.m. to 10 p.m. (Weekdays)
	10 p.m. to 8 a.m. (Weekends)	8 a.m. to 10 p.m. (Weekends)
All residential (except multiple dwelling)	45	55
Multiple-dwelling residential	50	60
Commercial	60	65
Light industry – I-R and I-L zone	70	70
Heavy industry – I zone	80	80

Note: dBA = A-weighted decibels

Title 17 of the CVMC (Environmental Quality), Chapter 24, addresses managing noisy and disorderly conduct. Section 17.24.040.C.8 specifically addresses restrictions against generation of construction noise in overnight periods. The use of any tools, power machinery, or equipment, or the conduct of construction and building work in residential zones so as to cause noises disturbing to the peace, comfort, and quiet enjoyment of property of any person residing or working in the vicinity, shall be prohibited between the hours of 10:00 p.m. and 7:00 a.m., Monday–Friday, and between the hours of 10:00 p.m. and 8:00 a.m., Saturday and Sunday, except when the work is necessary for emergency repairs required for the health and safety of any member of the community (City of Chula Vista 2020).

Although the City does not set specific numerical limits for noise associated with temporary construction activities, it can be perceived as a nuisance; thus the City restricts the times of day when construction may occur (7:00 a.m.–10:00 p.m., Monday–Friday, and 8:00 a.m.–10:00 p.m., Saturday and Sunday).

3 Existing Conditions

SPL measurements were conducted near the proposed project site on April 2, 2020, to quantify and characterize the existing outdoor ambient sound levels. Table 2 provides the location, date, and time period at which these baseline noise level measurements were performed by an attending Dudek field investigator using a Rion-branded Model NL-52 sound level meter (SLM) equipped with a 0.5-inch, pre-polarized condenser microphone with pre-amplifier. The SLM meets the current American National Standards Institute standard for a Type 1 (Precision Grade) sound level meter. The accuracy of the SLM was verified using a field calibrator before and after the measurements, and the measurements were conducted with the microphone positioned approximately 5 feet above the ground.

Four (4) short-term (ST) noise level measurement locations (ST1-ST4) that represent existing noise-sensitive receivers were selected on and near the proposed project site. These locations are depicted as receivers ST1-ST4 on Figure 3, Noise Measurement and Modeling Locations. The measured L_{eq} and L_{max} noise levels are provided in Table 2. The primary noise sources at the sites identified in Table 2 consisted of traffic along adjacent roadways, the sounds of leaves rustling, and birdsong. As shown in Table 2, the measured SPL ranged from approximately 67.2 dBA L_{eq} at ST3 to 45.6 dBA L_{eq} at ST2. Beyond the summarized information presented in Table 2, detailed noise measurement data is included in Appendix A, Baseline Noise Measurement Field Data.

Table 2. Measured Baseline Outdoor Ambient Noise Levels

Site	Location/Address	Date/Time	L_{eq} (dBA)	L_{max} (dBA)
ST1	East of 760 De La Toba Rd Chula Vista, CA 91911	2020-04-02, 11:50 AM to 12:00 PM	55.1	59.8
ST2	East of 651 Point Buchon Court, Chula Vista, CA 91911	2020-04-02, 10:50 AM to 11:00 AM	45.6	52.9
ST3	East 1501 Brandywine Ave Chula Vista, CA 91911	2020-04-02, 11:05 AM to 11:15 AM	67.2	81.2
ST4	Western boundary of proposed project	2020-04-02, 11:20 AM to 11:30 AM	56.3	68.5

Source: Appendix A.

Notes: L_{eq} = equivalent continuous sound level (time-averaged sound level); L_{max} = maximum sound level during the measurement interval; dBA = A-weighted decibels; ST = short-term noise measurement locations.

Generally, the measured samples of daytime L_{eq} agree with expectations: ST3 is above 67 dBA due largely to its proximity to Olympic Parkway, a major roadway; ST4 is farther up the bluff at the western boundary of the proposed project; and, ST1 and ST2 are well within the residential neighborhoods and much more distant from these sources of roadway traffic noise.

4 Thresholds of Significance

City of Chula Vista Diego Significance Determination Thresholds

The following significance criteria are based on Appendix G of the CEQA Guidelines (14 CCR 15000 et seq.) and will be used to determine the significance of potential noise impacts. Such potential noise and vibration impacts to the community would be considered significant if the proposed project would result in the following:

- a. Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
- b. Generation of excessive groundborne vibration or groundborne noise levels; and,
- c. Expose people residing or working in the project area to excessive noise levels (for a project located within the vicinity of a private airstrip or an airport land use plan, or where such a plan has not been adopted, within 2 miles of a public airport or public use airport).

In light of these above significance criteria, this analysis uses the following standards to evaluate potential noise and vibration impacts.

- Construction noise – The City regulates construction noise by restricting the allowable hours of construction. Section 9.40.110 of the CVMC exempts construction noise from the stationary noise standards, provided that construction occurs between 7:00 a.m. and 10:00 p.m., Monday through Friday, and 8:00 a.m. to 10:00 p.m., Saturday and Sunday. Through adherence to the limitation of allowable construction times provided in the CVMC, the construction-related noise levels would not exceed any standards. The existing residential receptors to the southwest of the proposed project site suggests that source-to-receiver distances are greater than 900 feet. Additionally, most construction equipment and vehicles on a project site do not operate continuously. To verify noise levels during construction would not be significant, consistent with the FTA guidance mentioned in Section 2, Regulatory Setting, this analysis will use 80 dBA L_{eq} over an 8-hour period as the construction noise impact criterion during daytime hours 7:00 a.m. and 10:00 p.m. Monday through Friday, and 8:00 a.m. to 10:00 p.m., Saturday and Sunday.
- Off-site project-attributed transportation noise – For purposes for this analysis, a direct roadway noise impact would be considered significant if increases in roadway traffic noise levels attributed to the proposed project were greater than 3 dBA CNEL at an existing noise-sensitive land use.

- Off-site project-attributed stationary noise – For purposes for this analysis, a noise impact would be considered significant if noise from typical operation of heating, ventilation, and air conditioning and other electro-mechanical systems associated with the proposed project exceeded 50 dBA hourly L_{eq} at the property line from 7:00 a.m. to 9:59 p.m., and 45 dBA hourly L_{eq} from 10:00 p.m. to 6:59 a.m.
- Construction vibration – Guidance from Caltrans indicates that a vibration velocity level of 0.2 ips PPV received at a structure would be considered annoying by occupants within (Caltrans 2013b). As for the receiving structure itself, aforementioned Caltrans guidance from Section 2 recommends that a vibration level of 0.3 ips PPV would represent the threshold for building damage risk.

For purposes of disclosure, since current CEQA noise criteria listed above do not consider it, this analysis also evaluates compatibility of on-site noise levels with the City of Chula Vista exterior and interior noise standards of 65 dBA CNEL and 45 dBA CNEL, respectively.

INTENTIONALLY LEFT BLANK

5 Impact Discussion

- a) *Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?*

Short-Term Construction

Construction noise and vibration are temporary phenomena. Construction noise and vibration levels vary from hour to hour and day to day, depending on the equipment in use, the operations performed, and the distance between the source and receptor.

Equipment that would be in use during construction would include, in part, graders, backhoes, excavators, dump trucks, loaders, cranes, dozers, gradalls, scrapers, cement mixers, pavers, rollers, welders, and air compressors. The typical maximum noise levels for various pieces of construction equipment at a distance of 50 feet are presented in Table 3. Usually, construction equipment operates in alternating cycles of full power and low power, producing average noise levels over time that are less than the listed maximum noise level. The average sound level of construction activity also depends on the amount of time that the equipment operates and the intensity of construction activities during that time

Table 3. Typical Construction Equipment Maximum Noise Levels

Equipment Type	Typical Equipment (L_{max} , dBA at 50 Feet)
Air compressor	78
Backhoe	78
Concrete pump truck	81
Dozer	85
Grader	85
Crane	81
Gradall	85
Scraper	85
Dump Truck	76

Generator	72
Front End Loader	79
Paver	77
Welder	74

Source: DOT 2006.

Note: L_{max} = maximum sound level; dBA = A-weighted decibels.

Aggregate noise emission from proposed project construction activities, broken down by sequential phase, was predicted at three distances to the nearest existing noise-sensitive receptor: 1) from the nearest position of the construction site boundary to the closest northern receptor, 2) from the nearest position of the construction site boundary to the closest western receptor and, 3) from the nearest position of the proposed new road boundary to the closest northern receptor. The intent of these distances is to help evaluate anticipated construction noise from a limited quantity of equipment or vehicle activity expected to be at the boundary for some period of time, which would be most appropriate for phases such as site preparation, grading, and paving. Table 4 summarizes these

three distances to the apparent closest noise-sensitive receptor for each of the five sequential construction phases. This analysis conservatively assumes a “worst-case” condition that places all pieces of construction equipment of each listed type per phase at the site boundary for the entire 8-hour period. In reality, at any given time some equipment may be further away from the site boundary.

Table 4. Estimated Distances between Construction Activities and the Nearest Noise-sensitive Receptors

Construction Phase (and Equipment Types Involved)	Distance from Nearest Noise Sensitive Receptor to North of Construction Site Boundary (Feet)	Distance from Nearest Noise Sensitive Receptor to West of Construction Site Boundary (Feet)	Distance from Nearest Noise Sensitive Receptor to North of Proposed New Road Boundary (Feet)
Architectural Coating (Air Compressor)	895	940	N/A
Site Preparation (Dozer, Front End Loader)	895	940	580
Grading (Excavator, Grader, Dozer, Scraper, Backhoe)	895	940	580
Building Construction (Crane, Gradall, Generator, Backhoe, Welder)	895	940	N/A
Paving (Paver, Dump Truck, Roller)	895	940	580

A Microsoft Excel-based noise prediction model emulating and using reference data from the Federal Highway Administration Roadway Construction Noise Model (RCNM) (FHWA 2008) was used to estimate construction noise levels at the nearest occupied noise-sensitive land use. (Although the RCNM was funded and promulgated by the Federal Highway Administration, it is often used for non-roadway projects, because the same types of construction equipment used for roadway projects are often used for other types of construction.) Input variables for the predictive modeling consist of the equipment type and number of each (e.g., two graders, a loader, a tractor), the duty cycle for each piece of equipment (e.g., percentage of time within a specific time period, such as an hour, when the equipment is expected to operate at full power or capacity and thus make noise at a level comparable to what is presented in Table 3, Typical Construction Equipment Maximum Noise Levels), and the distance from the noise-sensitive receiver. The predictive model also considers how many hours that equipment may be on site and operating (or idling) within an established work shift. Conservatively, no topographical or structural shielding was assumed in the modeling. The RCNM has default duty-cycle values for the various pieces of equipment, which were derived from an extensive study of typical construction activity patterns. Those default duty-cycle values were used for this noise analysis, which is detailed in Appendix B, Construction Noise Modeling Input and Output, and produce the predicted results displayed in Table 5.

Table 5. Predicted Construction Noise Levels per Activity Phase

Construction Phase (and Equipment Types Involved)	8-Hour L _{eq} at Nearest Noise Sensitive Receptor to North of Construction Site Boundary (dBA)	8-Hour L _{eq} at Nearest Noise Sensitive Receptor to West of Construction Site Boundary (dBA)	8-Hour L _{eq} at Nearest Noise Sensitive Receptor to North of Proposed New Road Boundary (dBA)
Architectural Coating (Air Compressor)	48.6	48.2	N/A
Site Preparation (Dozer, Front End Loader)	59.8	59.4	63.6
Grading (Excavator, Grader, Dozer, Scraper, Backhoe)	62.0	61.6	65.8
Building Construction (Crane, Gradall, Generator, Backhoe, Welder)	61.1	60.7	N/A
Paving (Paver, Dump Truck, Roller)	56.0	55.6	59.8

Notes: L_{eq} = equivalent noise level; dBA = A-weighted decibels.

As presented in Table 5, the estimated construction noise levels are predicted to be as less than 66 dBA L_{eq} over an 8-hour period at the nearest existing residences (as close as 580 feet away) when site preparation activities take place near the northern project boundaries. Note that these estimated noise levels at a source-to-receiver distance of 580 feet would occur when noted pieces of heavy equipment would each operate for a cumulative period for 8 hours a day. The predicted operation of construction equipment and processes do not exceed noise levels of 80 dBA L_{eq}, which the FTA recommends as a daytime threshold for construction noise exposure over an 8-hour period at a residential receptor. It is anticipated that construction activities associated with the proposed project would take place within the hours of 7:00 a.m. and 10:00 p.m., Monday through Friday, and 8 a.m. to 10 p.m., Saturday and Sunday. In summary, typical construction noise during allowable daytime hours would not exceed the aforementioned FTA guidance-based standard. Thus, temporary construction-related noise impacts would be **less than significant with mitigation**.

Long-Term Operational

Roadway Traffic Noise

The proposed project would result in the creation of additional vehicle trips on local roadways (i.e., Olympic Parkway), which could result in increased traffic noise levels at adjacent noise-sensitive land uses. Appendix C, Traffic Noise Modeling Input and Output, contains a spreadsheet with average daily traffic converted to peak hour traffic for Olympic Parkway and surrounding arterial roadways. These peak hour volumes were calculated by taking 10 percent of the average daily traffic and using a vehicle distribution of 97 percent autos, 2 percent medium trucks, and 1 percent heavy trucks. Consistent with the worked example in the Caltrans Technical Noise Supplement

("TeNS") that is considered 'fairly typical', peak hour volume is assumed to be 10 percent of ADT (Caltrans 2013a). In particular, the proposed project would create additional traffic along Olympic Parkway, which according to the Traffic Impact Assessment prepared for the proposed project (LLG, 2020) would add 5,760 average daily trips to the segment of Olympic Parkway and adjacent roadways surrounding the project site.

Potential noise effects from vehicular traffic were assessed using the Federal Highway Administration's Traffic Noise Model version 2.5 (FHWA 2004). Information used in the model included the roadway geometry, posted traffic speeds, and traffic volumes for the following scenarios: existing (year 2019), existing plus project, near-term (2024), and near-term plus project. Noise levels were modeled at representative noise-sensitive receivers ST1 through ST4, as shown in Figure 3. Demonstrating validity of the TNM model, predicted traffic noise levels for the existing (2019) without proposed project case shown in Table 6 compare well (i.e., within an average difference of 3 dBA) with the measured L_{eq} magnitudes of ST1 though ST4. Hence, on the basis of the TNM model accuracy for the existing (2019) without project case, future traffic noise levels can be predicted with confidence.

The City's Noise Element establishes a policy for exterior sensitive areas to be protected from high noise levels. The Noise Element sets 65 dBA CNEL for the outdoor areas and 45 dBA CNEL for interior areas as the normally acceptable levels. However, existing levels from traffic already exceed this threshold in the vicinity of ST3. For the purposes of this noise analysis, such impacts are considered significant when they cause an increase of 3 dB from existing noise levels. An increase or decrease in noise level of at least 3 dB is required before any noticeable change in community response would be expected (Caltrans 2013a). The receivers were modeled to be 5 feet above the local ground elevation. The noise model results are summarized in Table 6.

Table 6. Roadway Traffic Noise Modeling Results

Modeled Receiver Tag (Location Description)	Existing (2019) Noise Level (dBA CNEL)	Existing (2019) Plus Project Noise Level (dBA CNEL)	Near-term (2024) Noise Level (dBA CNEL)	Near-term (2024) Plus Project Noise Level (dBA CNEL)	Maximum Project-Related Noise Level Increase (dB)
ST1	59.1	61.1	61.8	62.1	2.0
ST2	48.9	48.5	49.2	49.2	0.0
ST3	71.1	70.8	71.4	72.1	0.7
ST4	63.9	62.9	63.5	63.8	0.3

Notes: dBA = A-weighted decibel; CNEL = Community Noise Equivalent Level; dB = decibel.

Table 6 shows that at all four listed representative receivers, the addition of proposed project traffic to the roadway network would result in a CNEL increase of less than 3 dB, which is below the discernible level of change for the average healthy human ear. At some modeled locations, expected traffic noise levels are predicted to decrease due to introduction of the proposed new buildings as sound path occlusion between them and the roadway noise source. Thus, a **less-than-significant impact** is expected for proposed project-related off-site traffic noise increases affecting existing residences in the vicinity.

Traffic Noise Exposure to Future Project Occupants

Aside from exposure to aviation traffic noise, current CEQA noise-related guidelines do not require an assessment of exterior-to-interior noise intrusion, environmental noise exposure to occupants of newly-created project residences, or environmental noise exposure to exterior non-residential uses attributed to the development of the

proposed project. Nevertheless, the California Building Code requires that interior background noise levels not exceed a CNEL of 45 dB within habitable rooms. Hence, the following predictive analysis of traffic noise exposure at the exteriors of occupied residences and outdoor living areas is provided for informational purposes.

In addition to the prediction results presented in Table 6, the FHWA TNM software was also used to predict the near-term plus Project scenario traffic noise levels at multiple on-site exterior areas, as listed in Table 7. Modeled receptor locations, which appear in Figure 3, include representative positions for the exteriors of the northern facades.

Table 7. On-Site Roadway Traffic Noise Modeling Results

Location	Modeled receiver	Description	Predicted Traffic Noise Exposure at Modeled Receiver (dBA CNEL)
Product B	M1-1	Patio	59.2
	M1-2	2nd floor	64.1
	M2-1	Patio	59.2
	M2-2	2nd floor	64.2
	M3-1	Patio	57.6
	M3-2	2nd floor	63.1
	M4-1	Patio	58.1
	M4-2	2nd floor	63.4
Product C	M5-1	Patio	58.6
	M5-2	2nd floor	64
	M5-3	3rd floor	64.9
	M6-1	Patio	58.6
	M6-2	2nd floor	64.1
	M6-3	3rd floor	64.9

Notes: dBA = A-weighted decibel; CNEL = Community Noise Equivalent Level.

Table 7 shows that at the modeled northern facade positions representing exterior walls of occupied living rooms or bedrooms that are closest to and face Olympic Parkway, predicted on-site CNEL values are all less than 65 dBA while others are compatible with the City's guidance for exterior noise levels.

Typically, when they feature open windows, building shells provide an average of 12-18 dB [OPR 2017] of exterior-to-interior noise reduction. Such building facades typical of residential construction with windows closed generally provide a minimum of 25 dB exterior-to-interior noise attenuation (FHWA 2011). An analysis of composite sound transmission class (STC) of sample project exterior wall assemblies, including fenestration, supports these general assertions as shown in Table 8 and are based on the following parameters:

- The exterior wall assembly includes (or is acoustically comparable to): one layer of 5/8" gypsum wallboard (GWB) on the interior-facing side, 2"x4" wood studs, glass fiber batt insulation in the stud cavities, and a thin stucco/plaster coating on one layer of 5/8" GWB (or what may instead be underlying wooden structural panels or sheathing having comparable mass).

- Windows are assumed to be single hung operable windows, featuring dual pane assembly composed of two 1/8"-thick glass panes separated by a 3/8" wide air-gap.
- For purposes of this analysis, doors are sliding-type and assumed to feature a dual-pane glazing system similar to the window assembly (i.e., two 1/8"-thick glass panes separated by a 3/8" wide air-gap) in narrow-perimeter frames. The analysis also assumes that these door products—akin to the windows—feature good seals and related hardware, so that when closed, the effective sound insulating performance is represented by the gap-separated glass panes.

Table 8. Predicted Net Sound Transmission Class of Sample Occupied Room Facade

Building & Sample Occupied Unit	Occupied Room Facade	Predicted Net Sound Transmission Class (STC) for Scenario				
		Closed Window(s) and Door(s)	Open Window	Open Window, Closed Door	Open Door, Closed Window	Open Door, Open Window
B	2 nd floor Bedroom	36	11	n/a	n/a	n/a
C	2 nd floor Living Room	35	n/a	14	9	7
C	3rd floor Bedroom	36	12	n/a	n/a	n/a

n/a = not applicable

Clearly, Table 8 illustrates that an open window or an open sliding door to an adjoining patio or balcony greatly compromises the sound insulation performance of the studied wall assemblies. However, when such windows and doors are closed, all studied sample facades are anticipated to exhibit a predicted STC rating of at least 35, and thus would provide sufficient exterior-to-interior sound insulation from outdoor traffic noise to yield interior background sound levels that are less than 45 dBA CNEL and thus compliant with the City and state standards. Recall that none of the predicted exterior traffic noise levels at the studied receptor locations exceeded 65 dBA CNEL; thus, the STC rating value (for closed windows and doors) subtracted from these exterior noise values must result in interior noise levels of less than 45 dBA CNEL (e.g., 65 – 35 = 30 dBA CNEL, which is less than 45). The apparent requirement for closed windows and doors means that the design of these habitable rooms should feature mechanical ventilation or an air-conditioning system to provide interior comfort of the occupants. Thus, implementation of project design feature **PDF-1** would help demonstrate that the expected resultant interior background noise level for planned project inhabited rooms would meet the state and City interior noise standard of 45 dBA CNEL.

PDF-1 An exterior-to-interior noise analysis shall be conducted by the project applicant for the proposed dwelling units facing the adjoining roadways (e.g., Olympic Parkway) prior to issuance of building permits. Installation of mechanical ventilation systems or air conditioning systems and sound-rated windows shall be required if the predicted interior background noise due to traffic noise intrusion through the building envelope assemblies exceeds the state and City's 45 dBA CNEL interior standard. The acoustical analysis shall substantiate that the resulting interior background noise levels, with appropriate implementation of interior comfort systems and sound insulation, will be less than this noise standard.

Stationary Operations Noise

The incorporation of new multifamily homes and a mix of open space uses attributed to development of the proposed project will add a variety of noise-producing mechanical equipment that include those presented and discussed in the

following paragraphs. Most of these noise-producing equipment or sound sources would be considered stationary, or limited in mobility to a defined area. Using a Microsoft Excel-based outdoor sound propagation prediction model, project-attributed operational noise at nearby community receptors was predicted using several assumptions:

- Treatment of exposed patio air-cooled condensing units as point-type sound emission sources; and,
- Point-source sound propagation (i.e., 6 dB per doubling of distance) that conservatively ignores acoustical absorption from atmospheric and ground surface effects.
- These condenser units would generally be installed near building exterior walls in private area “backyards” or external areas.
- While the condenser units are expected to be at-grade, the prediction model conservatively ignores potential noise path occlusion due to intervening building locations. Hence, should the proposed project design develop further and position these condenser units above grade level (e.g., on rooftops or balconies), the predictive analysis would still be considered accurate.

Please see Appendix D for quantitative details of the below predictions.

Residential Unit Heating, Ventilation, and Air Conditioning Noise

For purposes of this analysis, each of the new occupied residential units would be expected to feature a split-system type air-conditioning unit, with an air-cooled refrigeration (2-ton capacity) condenser unit at grade level.

Assuming each condenser unit has an SPL of 68 dBA at 3 feet based on available data from a likely manufacturer (Carrier 2012), the closest existing noise-sensitive residential receptor to the south of the proposed project's southernmost unit would be over 900 horizontal feet to the nearest of these condenser units. The predicted sound emission level from the combination of all 718 operating condenser units at offsite single-family receptors would be lower than 45 dBA L_{eq} and thus be compliant with the City's nighttime threshold of 50 dBA hourly L_{eq}. Under such conditions, the operation of residential air-conditioning units would result in a **less-than-significant noise impact**.

b) Would the project result in generation of excessive groundborne vibration or groundborne noise levels?

Conventional Construction Activity Vibration

Construction activities may expose persons to excessive groundborne vibration or groundborne noise, causing a potentially significant impact. Caltrans has collected groundborne vibration information related to construction activities (Caltrans 2013b). Information from Caltrans indicates that continuous vibrations with a PPV of approximately 0.2 ips is considered annoying. For context, heavier pieces of construction equipment, such as a bulldozer that may be expected on the project site, have peak particle velocities of approximately 0.089 ips or less at a reference distance of 25 feet (DOT 2006).

Groundborne vibration attenuates rapidly, even over short distances. The attenuation of groundborne vibration as it propagates from source to receptor through intervening soils and rock strata can be estimated with expressions found in FTA and Caltrans guidance. By way of example, for a bulldozer operating on site and as close as the northern project boundary (i.e., 580 feet from the nearest receiving sensitive land use) the estimated vibration velocity level would be 0.001 ips per the equation as follows (FTA 2006):

$$\text{PPV}_{\text{rcvr}} = \text{PPV}_{\text{ref}} * (25/D)^{1.5} = 0.19 = 0.089 * (25/580)^{1.5};$$

where PPV_{rcvr} is the predicted vibration velocity at the receiver position, PPV_{ref} is the reference value at 25 feet from the vibration source (the bulldozer), and D is the actual horizontal distance to the receiver. Therefore, at this predicted PPV, the impact of vibration-induced annoyance to occupants of nearby existing homes would be **less than significant**.

Construction vibration, at sufficiently high levels, can also present a building damage risk. However, the predicted 0.001 ips PPV at the nearest residential receiver 580 feet away from on-site operation of the bulldozer during grading would not surpass the guidance limit of 0.3 to 0.5 ips PPV for preventing damage to residential structures (Caltrans 2013b). Because the predicted vibration level at 580 feet is less than both the annoyance and building damage risk thresholds, vibration from project conventional construction activities is considered less than significant.

Once operational, the proposed project would not be expected to feature major on-site producers of groundborne vibration. Anticipated mechanical systems like pumps are designed and manufactured to feature rotating components (e.g., impellers) that are well-balanced with isolated vibration within or external to the equipment casings. On this basis, potential vibration impacts due to proposed project operation would be **less than significant**.

- c) *For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?*

There are no private airstrips within the vicinity of the project site. The closest airport to the project site is the Brown Field Municipal Airport approximately 2.5 miles southeast of the site. Impacts from aviation overflight noise exposure would be considered **less than significant**.

INTENTIONALLY LEFT BLANK

6 Mitigation Measures

The results indicate that potential impacts during construction and operation would be less than significant. No mitigation is required with proper implementation of the proposed project design features.

7 Summary of Findings

This noise report was conducted for the proposed project. The results indicate that potential impacts during construction would be less than significant with implementation of proposed project design features. Noise impacts due to operation of the proposed project (including traffic noise) would be less than significant. No further mitigation is required.
