## TRANSPORTATION IMPACT ANALYSIS

# SUNBOW II, PHASE 3

City of Chula Vista, California

May, 2021

## 1.0 INTRODUCTION

Linscott, Law & Greenspan Engineers (LLG) has prepared this transportation impact analysis to assess the potential impacts associated with the Sunbow II, Phase 3 project (Project) in the City of Chula Vista. The proposed Project includes constructing 718 multi-family units on approximately 44.2 acres within the 135.7-acre area designated Planning Area 23 in the 1998 Sunbow SPA Site Utilization Plan. The Project site is located south of Olympic Parkway, between Brandywine Avenue and Heritage Road. This report addresses the potential transportation impacts and effects from the proposed project.

The following sections are included in this report:

- Project Description
- Vehicle Miles Traveled (VMT) Background
- Project VMT Significance Criteria and Methodology
- Project VMT Analysis
- Local Mobility Analysis Approach & Methodology
- Assessment of Existing Conditions
- Vehicular Mobility Criteria
- Project Trip Generation, Distribution and Assignment
- Assessment of Near-Term Conditions
- Assessment of Build-Out Conditions
- Access Assessment
- Vehicular Mobility Deficiencies and Recommended Improvements

## 2.0 PROJECT DESCRIPTION

The scope of the Proposed Project encompasses approximately 135.7 acres and includes a 67.5-acre development area comprised of 718 multi-family units on 44.2 acres, a 0.9-acre Community Purpose Facility (CPF) site, 5.9 acres of public streets and 16.5 acres of manufactured slopes/basins. Approximately 4.3 acres of proposed Poggi Canyon Easement area, 0.3 acres of conserved wetland resource area, and 63.6 acres of adjacent MSCP Preserve area are also within the Project Area.

The Proposed Project's residential land use includes four unique multi-family attached residential product types with 15 unique floor plans, ranging in square footage from approximately 1,100 to 2,050 square feet in two- and three-story units. Each home includes a two-car garage and two to four bedrooms.

The Proposed Project includes a Chula Vista General Plan Amendment, Sunbow General Development Plan Amendment, Sunbow Sectional Planning Area (SPA) Plan Amendment, a rezone and a Tentative Map. The Proposed Project also includes a Chula Vista MSCP Boundary Adjustment that would implement minor adjustments to the Planning Area 23 development limits and the adjacent MSCP Preserve open space areas.

The Proposed Project includes a Chula Vista General Plan Amendment, Sunbow General Development Plan Amendment, Sunbow II SPA Plan Amendment, a rezone, and a Tentative Map. The Proposed Project also includes a Chula Vista MSCP Boundary Adjustment to implement minor adjustments to the development limits and the adjacent MSCP Preserve areas that would result in a 0.09-acre increase to MSCP Preserve Area and an MSCP Minor Amendment to address off-site grading adjacent to the southwestern boundary of the development area.

**Figure 2-1** shows the Project's Vicinity Map and **Figure 2-2** shows a more detailed Project Area Map. **Figure 2-3** shows the Project's site plan and the Sunbow II, Phase 3 Site Utilization Table, which shows the Project statistics.

## 3.0 REPORT APPROACH

In compliance with Senate Bill 743 (SB 743), this Transportation Impact Study evaluates the Project's potential vehicular impacts using a Vehicle Miles Traveled (VMT) metric, pursuant to direction from the Governor's Office of Planning and Research (OPR) in December 2018 (*Technical Advisory on Evaluating Transportation Impacts in CEQA*). Public Resources Code section 20199, enacted pursuant to SB 743, identifies Vehicle Miles Traveled (VMT) as an appropriate metric for measuring transportation impacts along with the elimination of automobile delay/Level of Service (LOS) for California Environmental Quality Act (CEQA) purposes statewide.

When OPR and the Secretary of Resources finalized the CEQA Guidelines implementing SB 743, it stated that a lead agency may elect to be governed by the VMT guidelines immediately. However, as of July 1, 2020, the VMT guidelines apply statewide.

In June 2020, the City of Chula Vista adopted their *Transportation Study Guidelines* (TSG) to comply with Senate Bill 743. However, at the time the Project's VMT analysis was prepared, the City was still in the process of developing their guidelines for VMT evaluation. Therefore, prior to June 2020, LLG coordinated with City Staff to develop an interim VMT analysis approach and methodology. The interim approach and methodology are consistent with the approved TSG for the purposes of evaluating the Project's potential vehicular impacts.

In addition to the VMT analysis, a Project-Specific Local Mobility Analysis (LMA) was also prepared that focuses on automobile delay/LOS. The LOS analysis was conducted to identify roadway deficiencies in the Project study area and recommend project improvements to address such deficiency; however, the CEQA significance determination for the proposed Project is based only on VMT and not on LOS.

### 3.1 Report Organization

This report is divided into two main analyses: a VMT Analysis and a Local Mobility Analysis:

#### VMT Analysis

**Section 4.0 – Vehicle Miles Traveled (VMT) Overview & Background:** This section presents background on VMT, SB 743, and Proposed Technical Guidance.

**Section 5.0 – Project VMT Significance Criteria, Methodology, and Analysis:** This section presents the Project's VMT significance criteria, VMT methodology, and Analysis to determine significant transportation impacts.

**Section 6.0 – VMT Impacts Summary & Mitigation Measures Analysis:** This section presents a summary of the Project's VMT impact and recommended mitigation measures.

### Local Mobility Analysis

**Section 7.0 – Local Mobility Analysis Methodology:** This section describes the specific study area and methodology used to produce the intersection and street segment analyses contained in the study. A discussion of the concept of LOS is also provided in this section.

**Section 8.0 – Existing Mobility Conditions:** This section presents a description of the study area, existing roadway geometrics and traffic counts.

**Section 9.0 – Substantial Effect Criteria:** This section describes the criteria used for the vehicular mobility analysis.

**Section 10.0 – Analysis of Existing Conditions:** The existing traffic volumes are analyzed for the purposes of providing baseline conditions within the study area. This section contains a summary of the existing analyses.

**Section 11.0 – Trip Generation, Distribution and Assignment:** This section discusses the trip generation, distribution and assignment associated with the proposed Project.

**Section 12.0 – Analysis of Existing + Project Conditions:** This section provides information on the Existing + Project roadway conditions and traffic volumes. The results of the analyses of the addition of project traffic onto existing conditions are presented in this section.

**Section 13.0 – Cumulative Projects:** This section provides information on other projects in the study area that will add traffic to the local circulation system in the near future.

**Section 14.0 – Analysis of Near-Term Conditions:** This section provides information on the Near-Term roadway conditions and traffic volumes. The results of the analyses of the addition of project traffic onto Near-Term conditions are presented in this section.

**Section 15.0 – Assessment of Year 2035 Conditions:** This section provides information on Year 2035 conditions.

**Section 16.0 – Access Assessment:** This section provides information on the Project's proposed access points.

**Section 17.0 –Substantial Effects and Operational Improvements:** This section presents the transportation deficiencies caused by the addition of project traffic under Existing + Project and Near-Term analyses and the recommended improvements.

## **4.0 VEHICLES MILES TRAVELED (VMT): OVERVIEW AND BACKGROUND**

This section presents an overview and background on VMT and the implementation of California State Law Senate Bill 743 (SB 743) requiring its use in the evaluation of transportation impacts for CEQA.

The City of Chula Vista adopted their *Transportation Study Guidelines* (TSG) in June of 2020. However, at the time the Project's VMT analysis was prepared, the City was still in the process of developing their guidelines for VMT evaluation. Therefore, prior to June 2020, LLG coordinated with City Staff to develop an interim approach and methodology, and to obtain the City's draft screening map which identifies residential VMT per capita for locations Regionwide. The interim approach and methodology are consistent with the approved *TSG* for the purposes of evaluating the Project's potential vehicular impacts.

### **4.1 VMT Background**

VMT is defined as a measurement of miles traveled by vehicles within a specified region and for a specified time period. VMT is a measure of the use and efficiency of the transportation network. VMTs are calculated based on individual vehicle trips generated and their associated trip lengths. VMT accounts for two-way (round trip) travel and is estimated for a typical weekday for the purposes of measuring transportation impacts. For residential projects, “VMT per capita” is the efficiency metric used for evaluation. In general, the analysis presents the project VMT per capita, and compares it to a regional VMT per capita to determine if the former is higher, equal to, or lower than the latter.

### **4.2 Senate Bill 743**

In September 2013, the Governor’s Office signed SB 743 into law, starting a process that fundamentally changes the way transportation impact analysis is conducted under CEQA. Within the State’s CEQA Guidelines, these changes include the elimination of auto delay, LOS, and similar measurements of vehicular roadway capacity and traffic congestion as the basis for determining significant impacts. The guidance identifies VMT as the most appropriate CEQA transportation metric, along with the elimination of auto delay / LOS for CEQA purposes statewide. The justification for this paradigm shift is that auto delay/ LOS impacts lead to improvements that increase roadway capacity and therefore induce more traffic and greenhouse gas emissions. The legislation was also intended to incentivize development in and around Transit Priority Areas (TPAs) and High-Quality Transit Corridors (HQTC’s), and to encourage high density infill and mixed-use projects.

In January 2016, the Governor’s Office of Planning and Research (OPR) issued Draft Guidance, which provided recommendations for updating the State’s CEQA Guidelines in response to SB 743 and recommended practice for VMT analysis in an accompanying “*Technical Advisory on Evaluating Transportation Impacts in CEQA*” (Technical Advisory). OPR’s most recent Technical Advisory is dated December 2018.

## 4.3 Proposed Technical Guidance

The following information is sourced from OPR's latest Technical Advisory (December 2018). This represents a non-regulatory advisory document on the evaluation of transportation impacts using VMT.

### 4.3.1 General Recommendations Regarding Methodology

The following is a discussion of the general methodology recommendations to evaluate VMT for various technical areas and project types. The Sunbow project would fall within the "Residential Projects" category, and the SANDAG Series 13 Year 2020 Travel Demand Model was used in the analysis presented in this report.

#### Using Models to Estimate VMT

Travel demand models, sketch models, spreadsheet models, research, and data can all be used to calculate and estimate VMT. To the extent possible, lead agencies should choose models that have sensitivity to features of the project that affect VMT. Those tools and resources can also assist in establishing thresholds of significance and estimating VMT reduction attributable to mitigation measures and project alternatives.

#### Vehicle Types

Vehicle Miles Traveled refers to on-road passenger vehicles, specifically cars and light trucks. Heavy-duty truck VMT could be included for modeling convenience and ease of calculation.

#### Residential Projects

Residential project VMT is evaluated in terms of VMT per capita, with project results compared to established VMT thresholds to determine significance of project impacts.

#### Transit Priority Area (TPA)

Any project that includes in its geographic bounds a portion of an existing or planned Transit Priority Area (i.e., the project is within a ½ mile of an existing or planned major transit stop or an existing stop along a high-quality transit corridor) may employ VMT as its primary metric of transportation impact for the entire project. A high-quality transit corridor is defined as a corridor with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours.

### 4.3.2 Recommendations Regarding Significance Thresholds

Lead agencies have the discretion to set or apply their own thresholds of significance. However, the criteria for determining the significance of transportation impacts should promote:

- Reduction of greenhouse gas emissions;
- Development of multimodal transportation networks; and
- A diversity of land uses

Given that the City had not yet adopted VMT thresholds at the time the Project's VMT analysis was prepared, the OPR Technical Advisory methodology was used for the Project's VMT analysis:

***Residential Projects:*** A proposed project exceeding a level of fifteen percent (15%) below existing VMT per capita may indicate a significant transportation impact. Existing VMT per capita may be measured as Regional VMT per capita or as City VMT per capita.

Thus, for this analysis, the minimum threshold of significance for determination of the Project's transportation impact is ***15% or less of the Regional VMT per capita***. Any project whose VMT per capita is 15% or more below the Regional mean is presumed to be less than significant. This approach is consistent with the approved *TSG*.

## 5.0 VMT ANALYSIS

### 5.1 Local Agency Transition to SB743

In June 2020, the City of Chula Vista adopted their *Transportation Study Guidelines* (TSG) to comply with Senate Bill 743, which replaced Level of Service (LOS) with Vehicle Miles Traveled (VMT) as the metric for determining the significance of a project's transportation impacts under the California Environmental Quality Act (CEQA). -

Since the VMT analysis for the Project was prepared prior to formal adoption of the City's *TSG*, LLG consulted with City of Chula Vista staff and was instructed to utilize OPR guidance from the Technical Advisory and San Diego ITE Regional Guidelines to develop significance thresholds and technical methodologies for the Project.

### 5.2 Significance Criteria

Guidance from OPR's Technical Advisory is used to establish a significance threshold of a minimum 15% reduction or more from the Regional average VMT per capita for this residential evaluation. That means that if the Project's VMT per capita is more than 15% below the regional average, no significant transportation impact would result. This approach is consistent with the approved *TSG*.

### 5.3 Map-Based Screening

Prior to any detailed project-specific VMT analysis, OPR allows for the use of a "map-based screening" (screening map) to identify if a project would result in a less-than-significant impact. The City of Chula Vista's screening map which has been developed for their forthcoming VMT guidelines was utilized for the Project. This map provides VMT per capita evaluation for locations throughout the City, and accounts for surrounding land uses, population density, and transportation infrastructure in accordance with OPR guidelines. These elements collectively shape mobility behavior and provide a strong indication of expected project VMT.

In general, higher density and mix of land uses with access to mobility options are expected to generate lower VMT.

#### 5.3.1 Screening Map Results

The City of Chula Vista's VMT Screening Tool (screening map) allows for a search by address of properties within the City of Chula Vista. The data presented in the screening map includes:

- Census Tract
- VMT per capita
- Percent of regional mean
- Residents
- Description of VMT results

**Figure 5-1** shows a screen capture of the overall screening map. This figure shows the project location, the City boundaries, and the TPAs and HQTCs identified within the City. The data represented on this map follows the OPR guidance and displays VMT efficient areas that are 85% or less of the SANDAG regional average. The data shown is based on the SANDAG Series 13 Activity Based Model #1 (ABM1) for the base year of the model (2012).

As shown on *Figure 5-1*, the Project site is not fully located within a HQTC or TPA. A small portion of the Project site is within 0.5 miles (as the crow flies) of a High-quality Transit Corridor. Given the layout of the street network, pedestrians would have to walk more than one-mile from the project access driveway onto Olympic Parkway to the nearest bus stop on an HQTC line (route 712). Therefore, the project is not eligible for transit-based screening and a VMT per capita analysis was conducted as described below.

It should be noted that the SANDAG Series 14 ABM 2, including the base year 2016 VMT per employee by census tract data, was subsequently released following the preparation of the VMT analysis for the Project. The VMT analysis for the Project was performed based on Series 13 ABM 1, since Series 14 had not yet been released at the time the analysis was started.

#### 5.4 VMT Analysis

In order to calculate the VMT per capita for the baseline and the Project, the SANDAG Series 13 Year 2020 Travel Demand Model was used. The model generates a land use-specific average trip length (residential) as well as an average daily volume, which ultimately calculates the total residential VMT per capita, both regionwide and for the Project. The SANDAG Series 13 Year 2020 Travel Demand Model results are included in *Appendix I*.

**Table 5-1** summarizes the Regional average baseline VMT results provided by SANDAG using the Series 13 model. As seen in *Table 5-1*, the Regional average baseline VMT per capita is 16.4 miles per resident. For the purpose of determining the significance of VMT impacts, the Project VMT per capita would need to be 85% below the Regional average, which equates to 13.9 VMT per capita.

Similar to the Regional average baseline calculations, the Project VMT per capita was determined. However, since the Project site is currently zoned for industrial use, is coded as such in the SANDAG model, and it is difficult to accurately override the zoned land uses, a proxy site located just a few hundred feet north of the Project site with similar residential land use characteristics was used to determine the expected VMT per resident.

The proxy site is Traffic Analysis Zone (TAZ) 4728. It contains single-family residential units and is located immediately north of the Project site on Olympic Parkway. Typically trip lengths associated with residential uses are approximately 8.0 miles, therefore the use of a proxy site just a few hundred feet away would still result in an accurate VMT calculation. In addition, per SANDAG's (*Not So Brief guide of Vehicular Traffic Generation Rates for the San Diego Region*, April 2002), single-family and multi-family residential units have the same trip lengths, so the difference in unit type between the proxy site and the Project site is not relevant. The proxy site does not have direct access

to Olympic Parkway, but this results in longer trip lengths (and therefore more VMT) as compared to the Project site, and therefore the VMT analysis is conservative. Lastly, OPR and SANDAG do not differentiate VMT between multi-family and single-family land uses so the fact that the proxy site contains single-family uses is not relevant.

As shown in *Table 5–1*, the Project average VMT per capita for TAZ 4728 is calculated at 14.1 VMT per resident.

**Since the Project VMT per capita is higher than 85% of the Regional average, a significant VMT impact is calculated.**

The results of the Project VMT comparison indicate that the Project would exceed the significance threshold by 1.4%. This would require a reduction of 1.4% or more to reduce the VMT to below the significance threshold.

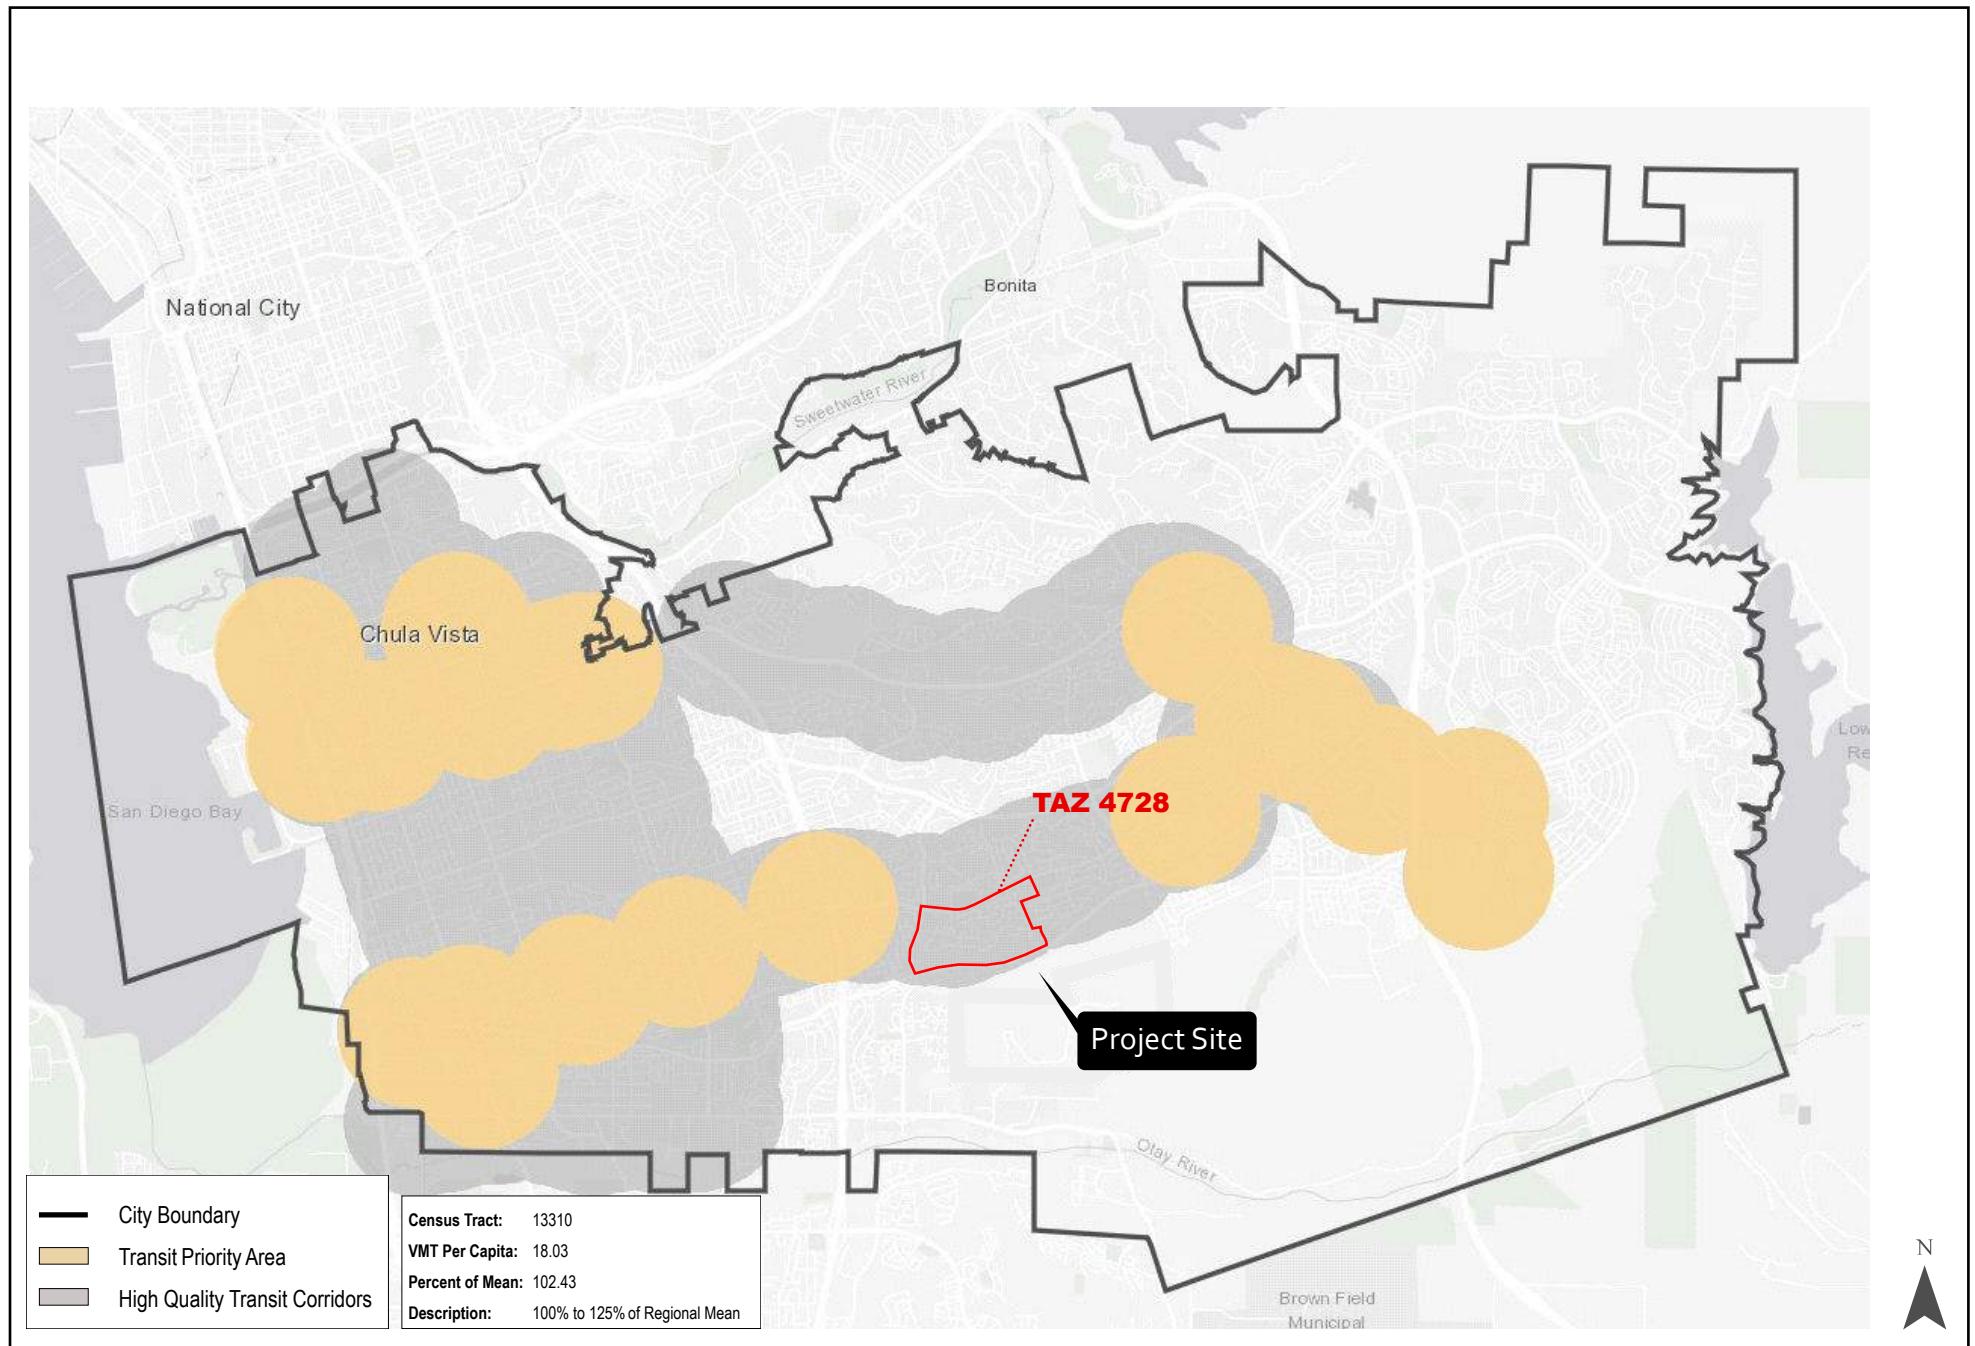

TABLE 5–1  
PROJECT VEHICLE MILES TRAVELED ANALYSIS

VMT per Resident					
Geography	Residents	Total Trips	Person Miles of Travel	Vehicle Miles of Travel	VMT per Resident
San Diego Region	3,435,715	12,302,411	77,559,665	56,353,219	16.4
<i>Significance Threshold (85% of Regional Average VMT)</i>					13.9
Project Site <sup>a</sup>	2,053	7,173	41,393	28,780	14.1
<b>Exceeds Threshold?</b>					<b>Yes</b>

*Footnotes:*

- a. Since the Project site is currently zoned for industrial use, and is coded as such in the SANDAG model, a proxy site in the vicinity with similar characteristics was used to determine the expected VMT per resident. The proxy site is Traffic Analysis Zone (TAZ) 4728, and is located immediately north of the Project site on Olympic Parkway.

Figure 5-1  
Chula Vista Overall VMT Screening Map

## 6.0 VMT IMPACTS SUMMARY & MITIGATION MEASURES

Based on the screening map review and the Project specific VMT analysis presented in *Section 5*, a **significant transportation impact is calculated**. Several quantifiable Transportation Demand Management (TDM) strategies can be used to mitigate a project's VMT impacts. TDM strategies can be quantified using methodologies described in *Quantifying Green House Gas Mitigation Measures* published by the California Air Pollution Control Officers Association (CAPCOA) in 2010.

The transportation demand management measures identified in the CAPCOA document that would potentially mitigate residential project impacts are grouped into five (5) categories:

1. Land Use/ Location (“LUT” series measures)
2. Neighborhood/ Site Enhancement (“SDT” series measures)
3. Parking Policy/ Pricing (“PDT” series measures)
4. Commute Trip Reduction Programs (“TRT” series measures)
5. Transit System Improvements (“TST” series measures)

Upon review of the various categories and their respective measures, some Land Use/ Location series measures would apply to the overall Project VMT of 14.1 VMT per capita based on the intrinsic characteristics of the Project (e.g. suburban infill, proximity to transit, schools, employment, etc.). The overall maximum reduction of all Transportation Measures combined is 15%.

### 6.1 Trip Reduction Strategies

While many of the CAPCOA Measures were considered applicable to the Project, the following Land Use / Location series measure was selected to mitigate the Project's VMT impact:

**LUT-1: Increase Density** – Designing the Project with increased densities, where allowed by the General Plan and / or Zoning Ordinance reduces GHG emissions associated with traffic in several ways. Density is usually measured in terms of persons, jobs, or dwelling units per unit area. Increased densities affect the distance people travel and provide greater options for the mode of travel they choose.

This measure is applicable to the Project because it proposes 718 multi-family residential dwelling units with a density of 16.3 units per acre, whereas the calculated VMT per resident of 14.1 is based on a proxy site where the residential dwelling units are exclusively single family.

### 6.2 VMT Reduction Analysis

**Figure 6-1** illustrates a chart that outlines the maximum reduction at all levels and the global reduction given the Project setting as provided in the CAPCOA report as Chart 6-2. The calculations provided in the CAPCOA methodology for the recommended measure produces a VMT reduction based on the number of dwelling units per acre. Based on a density of 16.3 units per acre the VMT

reduction is 8.0%. This mitigation exceeds the Project's 1.4% VMT impact and is therefore considered sufficient to reduce the Project's VMT impact to less than significant.

**Appendix G** contains the CAPCOA VMT calculations and excerpts from the CAPCOA report. **Table 6-1** summarizes the VMT mitigation results.

**TABLE 6-1**  
**PROJECT VMT MITIGATION RESULTS**

Mitigation Measure	Range of Effectiveness	DU / Acre	Resulting VMT Reduction	Project VMT to be Reduced	Impact Fully Mitigated?
LUT-1: Increase Density	0.8-30.0% VMT	16.3	8.0%	1.4%	Yes

**General Notes:**

1. Results based on methodology from *Quantifying Green House Gas Mitigation Measures* (CAPCOA – 2010)

In addition, the following trip reduction strategies will be implemented as Project features and conditions of approval, with implementation required at 50% occupancy. These strategies will further reduce the number of automobile trips generated by residents of the Project and the distance that the residents drive:

- Provide Ride Share coordination services thru the Project's Home Owner's Association to match residents interested in carpooling.
- Coordinate with near-by schools and / or the Project's Home Owner's Association to match residents interested in carpooling to / from schools.
- Provide on-site transit opportunities information.
- Encourage bicycling by providing on-site bicycle infrastructure such as bike racks.

Transportation Measures (Five Subcategories) Global Maximum Reduction (all VMT): urban = 75%; compact infill = 40%; suburban center or suburban with NEV = 20%; suburban = 15%						Global Cap for Road Pricing needs further study
Transportation Measures (Four Categories) Cross-Category Max Reduction (all VMT): urban = 70%; compact infill = 35%; suburban center or suburban with NEV = 15%; suburban = 10%						Max Reduction = 25% (all VMT)
Land Use / Location  Max Reduction: urban = 65%; compact infill = 30%; suburban center = 10%; suburban = 5%	Neighborhood / Site Enhancement  Max Reduction: without NEV = 5%; with NEV = 15%	Parking Policy / Pricing  Max Reduction = 20%	Transit System Improvements  Max Reduction = 10%	Commute Trip Reduction (assumes mixed use)  Max Reduction = 25% (work VMT)	Road Pricing Management  Max Reduction = 25%	Vehicles
Density (30%)	Pedestrian Network (2%)	Parking Supply Limits (12.5%)	Network Expansion (8.2%)	CTR Program  Required = 21% work VMT Voluntary = 6.2% work VMT	Cordon Pricing (22%)	Electrify Loading Docks
Design (21.3%)	Traffic Calming (1%)	Unbundled Parking Costs (13%)	Service Frequency / Speed (2.5%)	Transit Fare Subsidy (20% work VMT)	Traffic Flow Improvements (45% CO <sub>2</sub> )	Utilize Alternative Fueled Vehicles
Location Efficiency (65%)	NEV Network (14.4) <NEV Parking>	On-Street Market Pricing (5.5%)	Bus Rapid Transit (3.2%)	Employee Parking Cash-out (7.7% work VMT)	Required Contributions by Project	Utilize Electric or Hybrid Vehicles

## Transportation Strategies Organization

Sunbow II, Phase 3

## **7.0 LOCAL MOBILITY ANALYSIS STUDY AREA, ANALYSIS APPROACH AND METHODOLOGY**

In addition to the VMT analysis presented above, a Project-Specific Local Mobility Analysis (LMA) was also prepared that focuses on automobile delay and LOS. The LOS analysis was conducted to identify Project effects on the roadway operations in the Project study area and recommend Project improvements to address noted deficiencies; however, the CEQA impact significance determination for the proposed Project is based only on VMT and not on LOS.

### **7.1 Study Area**

The following study area was developed based on the anticipated assignment of Project traffic and locations which will carry the most Project traffic, per City of Chula Vista staff coordination and scoping meetings.

#### **INTERSECTIONS**

1. Olympic Parkway / I-805 Southbound Ramps
2. Olympic Parkway / I-805 Northbound Ramps
3. Olympic Parkway / Oleander Avenue
4. Olympic Parkway / Brandywine Avenue
5. Olympic Parkway / Project Driveway (West)
6. Olympic Parkway / Project Driveway (East)
7. Olympic Parkway / Heritage Road
8. Olympic Parkway / Santa Venetia Street
9. Olympic Parkway / La Media Road

#### **STREET SEGMENTS**

##### **Olympic Parkway**

1. West of I-805 Ramps
2. I-805 Ramps to Oleander Avenue
3. Oleander Avenue to Brandywine Avenue
4. Brandywine Avenue to Project Driveway (West)
5. Project Driveway (West) to Project Driveway (East)
6. Project Driveway (East) to Heritage Road
7. Heritage Road to Santa Venetia Street
8. Santa Venetia Street to La Media Road
9. La Media Road to Palomar Street

## 7.2 Analysis Scenarios

This study includes analysis of the following scenarios:

- Existing
- Existing + Project
- Near-Term without Project
- Near-Term with Project
- Year 2035

## 7.3 Analysis Methodology

There are various methodologies used to analyze signalized intersections and unsignalized intersections. The measure of effectiveness for intersection operations is Level of Service (LOS), which denotes the operating conditions which occur at a given intersection under various traffic volume loads.

LOS is a qualitative measure used to describe a quantitative analysis considering factors such as roadway geometries, signal phasing, speed, travel delay, freedom to maneuver, and safety. LOS provides an index to the operational qualities of a roadway segment or an intersection. Levels of service designations range from A to F, with LOS A representing the best operating conditions and LOS F representing the worst. LOS designation is reported differently for signalized and unsignalized intersections. In the 2010 Highway Capacity Manual (HCM), LOS for signalized intersections is defined in terms of delay. The LOS analysis results in seconds of delay expressed in terms of letters A through F. Delay is a measure of driver discomfort, frustration, fuel consumption, and lost travel time.

**Table 7-1** summarizes the signalized intersections levels of service descriptions. **Table 7-2** depicts the intersection LOS and corresponding delay ranges, which are based on overall intersection delay (signalized intersections) and the average control delay for any particular minor movement (unsignalized intersections), respectively. LOS relative to signalized intersection is further described below.

LOS A describes operations with very low delay, (i.e., less than 10.0 seconds per vehicle). This occurs when progression is extremely favorable, and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay.

LOS B describes operations with delay in the range 10.1 seconds and 20.0 seconds per vehicle. This generally occurs with good progression and/or short cycle lengths. More vehicles stop than for LOS A, causing higher levels of average delay.

LOS C describes operations with delay in the range 20.1 seconds and 35.0 seconds per vehicle. These higher delays may result from fair progression and/or longer cycle lengths. Individual cycle failures may begin to appear. The number of vehicles stopping is significant

at this level, although many still pass through the intersection without stopping.

LOS D describes operations with delay in the range 35.1 seconds and 55.0 seconds per vehicle. At LOS D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or higher volume (demand) / capacity (v/c) ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are frequent.

LOS E describes operations with delay in the range of 55.1 seconds to 80.0 seconds per vehicle. This is considered to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high v/c ratios. Individual cycle failures are frequent occurrences.

LOS F describes operations with delay in excess of over 80.0 seconds per vehicle. This is considered to be unacceptable to most drivers. This condition often occurs with over-saturation (i.e., when arrival flow rates exceed the capacity of the intersection). It may also occur at high v/c ratios below 1.00 with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing causes to such delay levels.

TABLE 7-1  
INTERSECTION LEVEL OF SERVICE DESCRIPTIONS

Level of Service	Description
A	Occurs when progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay.
B	Generally, occurs with good progression and/or short cycle lengths. More vehicles stop than for LOS A, causing higher levels of average delay.
C	Generally, results when there is fair progression and/or longer cycle lengths. Individual cycle failures may begin to appear in this level. The number of vehicles stopping is significant at this level, although many still pass through the intersection without stopping.
D	Generally, results in noticeable congestion. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high volume-to-capacity ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.
E	Considered to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high volume-to-capacity ratios. Individual cycle failures are frequent occurrences.
F	Considered to be unacceptable to most drivers. This condition often occurs with over saturation i.e. when arrival flow rates exceed the capacity of the intersection. It may also occur at high volume-to-capacity ratios below 1.00 with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing causes to such delay levels

**TABLE 7–2**  
**INTERSECTION LOS & DELAY RANGES**

<b>LOS</b>	<b>Delay (seconds/vehicle)</b>
	<b>Signalized Intersections</b>
A	$\leq 10.0$
B	10.1 to 20.0
C	20.1 to 35.0
D	35.1 to 55.0
E	55.1 to 80.0
F	$\geq 80.1$

*Source:* Highway Capacity Manual

### 7.3.1 *Signalized Intersections*

For signalized intersections, LOS criteria are stated in terms of the average control delay per vehicle for a 15-minute analysis period. Control delay includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. Actual traffic signal timing data for each location was obtained from City of Chula Vista records, and inputted into the respective intersections.

Signalized intersections were analyzed under AM and PM peak hour conditions. Average vehicle delay was determined using the methodology from Chapter 19 of the *Highway Capacity Manual 6<sup>th</sup> Edition (HCM 6)*, with the assistance of the *Synchro* (version 10) computer software.

### 7.3.2 *Street Segments*

Street segment analysis is based upon the comparison of average daily traffic volumes (ADTs) to the City of Chula Vista's *Roadway Classification, Level of Service, and ADT Table*. This table provides segment capacities for different street classifications, based on traffic volumes and roadway characteristics. The City of Chula Vista's *Roadway Classification, Level of Service and ADT* table is shown in **Table 7–3**.

**TABLE 7-3**  
**CITY OF CHULA VISTA ROADWAY CAPACITY STANDARDS**  
**AVERAGE DAILY VEHICLE TRIPS**

Road		Level Of Service (LOS)				
Class	X-Section V/C Ratio	A (0.6)	B (0.7)	C (0.8)	D (0.9)	E (1.0)
Expressway	104/128	52,000	61,300	70,000	78,800	87,500
Prime Arterial	104/128	37,500	43,800	50,000	56,300	62,500
Major Street (6 lanes)	104/128	30,000	35,000	40,000	45,000	50,000
Major Street (4 lanes)	80/104	22,500	26,300	30,000	33,800	37,500
Class I Collector	74/94	16,500	19,300	22,000	24,800	27,500

## 8.0 EXISTING MOBILITY CONDITIONS

Effective evaluation of the traffic effects associated with the proposed Project requires an understanding of the existing transportation system within the project area. **Figure 8-1** shows an existing conditions diagram, including signalized intersections and lane configurations.

### 8.1 Existing Roadway Conditions

The following is a description of the major roadways located within the immediate vicinity of the Project site at the time of the existing counts.

**Olympic Parkway** is classified as a Prime Arterial in the City of Chula Vista Circulation Plan. It is built as a six-lane divided road with three lanes westbound and three lanes eastbound and a raised median. The posted speed limit is 45 mph from I-805 to Brandywine Avenue and 50 mph east of Brandywine Avenue.

**Oleander Avenue** is classified as a two-lane collector street in the City of Chula Vista Circulation Plan. It is built as a two-lane undivided road with one lane northbound and one lane southbound. The posted speed limit is 25 mph.

**Brandywine Avenue** is classified as a Class I collector in the City of Chula Vista Circulation Plan. It is built as a four-lane undivided road with two lanes northbound and two lanes southbound north of Olympic Parkway, and as a two-lane undivided road with one lane northbound and one lane southbound south of Olympic Parkway. The posted speed limit is 40 mph north of Olympic Parkway and 35 mph south of Olympic Parkway.

**Heritage Road** is classified as a Prime Arterial in the City of Chula Vista Circulation Plan. Currently it is built as a six-lane divided road with three lanes northbound and three lanes southbound. The posted speed limit is 40 mph.

**Santa Venetia Street** is classified as a two-lane collector in the City of Chula Vista Circulation Plan. Currently it is built as a two-lane undivided road with one lane northbound and one lane southbound, south of Olympic Parkway. The assumed speed limit is 25 mph.

**La Media Road** is classified as a Prime Arterial in the City of Chula Vista Circulation Plan. Currently it is built as a six-lane divided road with three lanes northbound and three lanes southbound. The posted speed limit is 45 mph.

### 8.2 Existing Intersection Traffic Volumes

Weekday daily, and AM and PM peak hour intersection turning movement volume counts were commissioned on Thursday, January 16, 2020. The intersection counts were conducted between the hours of 7:00-9:00 AM and 4:00-6:00 PM to capture peak commuter activity. Area schools were in session during the time of the counts.

Traffic signal timing sheets were obtained from the City of Chula Vista and Caltrans and used in the intersection analyses.

*Appendix A* contains the count sheets and signal timing sheets.

*Figure 8–2* shows the existing traffic volumes.

### 8.3 Existing Bicycle Network

There is a Class 2 bike lane on Olympic Parkway between Oleander Avenue and Lake Crest Drive. There is a Class 2 bike lane on Brandywine Avenue beginning at Telegraph Canyon Road and ending at Main Street. There is a Class 2 bike lane on Heritage Road beginning at Telegraph Canyon Road and ending at Main Street. Class 2 bike lanes are provided on both sides of La Media Road beginning at Telegraph Canyon Road and ending at Santa Luna Street.

### 8.4 Existing Pedestrian Conditions

Sidewalks are provided along both sides of Olympic Parkway, Oleander Avenue, Brandywine Avenue, Santa Venetia Street, and La Media Road. Sidewalks are also provided on both sides of Heritage Road. The Chula Vista Regional Trail is located along the west side of Heritage Road south of Olympic Parkway. Four signalized crosswalks with ramps on each corner are located adjacent to the Project site at the intersection of Olympic Parkway and Brandywine Avenue.

### 8.5 Existing Transit Conditions

The Project area is served by transit provided by the San Diego Metropolitan Transit System (MTS). There are no bus routes that travel directly along Olympic Parkway within the Project study area. The following five (5) MTS bus routes serve the general study area:

- **Route 225** runs from the Otay Mesa Transit Center to the Santa Fe Depot Transit Center via Broadway, I-805, and SR-125, as well as other streets that are not near the Project study area. There are 11 stops along this route with destinations to the East Palomar Transit Station, City College Transit Center, and the Santa Fe Depot.

Route 225 currently operates Monday through Friday from 4:49 AM through 10:13 PM departing from the Otay Mesa Transit Center and from 6:08 AM through 11:39 PM departing from The Santa Fe Depot Transit Center. Saturday and Sunday route schedule begins at 4:49 AM through 10:11 AM departing from the Otay Mesa Transit Center and begins at 6:08 AM to 11:37 PM departing from the Santa Fe Depot Transit Center. Route 225 operates on observed holidays with a Saturday or Sunday schedule. Weekday schedules include 30-minute headways. Weekend schedules include 30-minute headways.

- **Route 704** runs from the E Street Transit Center to the Palomar Street Transit Center via East Orange Avenue, Brandywine Avenue, and East Palomar Street, as well as other streets that are not near the project study area. There are 48 stops along this route with

destinations to the Chula Vista Public Library, Civic Center, Memorial Park, Sharp CV Medical Center, South County Regional Center, and the Veterans Home.

Route 704 currently operates Monday through Friday from 6:03 AM through 8:20 PM departing from the E Street Transit Center and from 5:28 AM through 9:00 PM departing from The Palomar Street Transit Center. Saturday route schedule begins at 6:26 AM through 8:25 AM departing from the E Street Transit Center and begins at 6:28 AM to 8:29 PM departing from the Palomar Street Transit Center. Sunday schedule begins at 7:22 AM through 6:22 PM departing from Sharp Medical Center and begins at 7:30 AM through 6:30 PM departing from the Palomar Street Transit Center. Route 704 operates on observed holidays with a Saturday or Sunday schedule. Weekday schedules include 30-minute headways. Weekend schedules include 1-hour headways.

- **Route 707** runs from Eastlake Parkway and Olympic Parkway to Southwestern College via East H Street and Eastlake Parkway. There are 26 stops along this route with destinations to Bonita Vista High School, Eastlake High School, Eastlake Village Center, Otay Ranch Town Center, and Southwestern College.

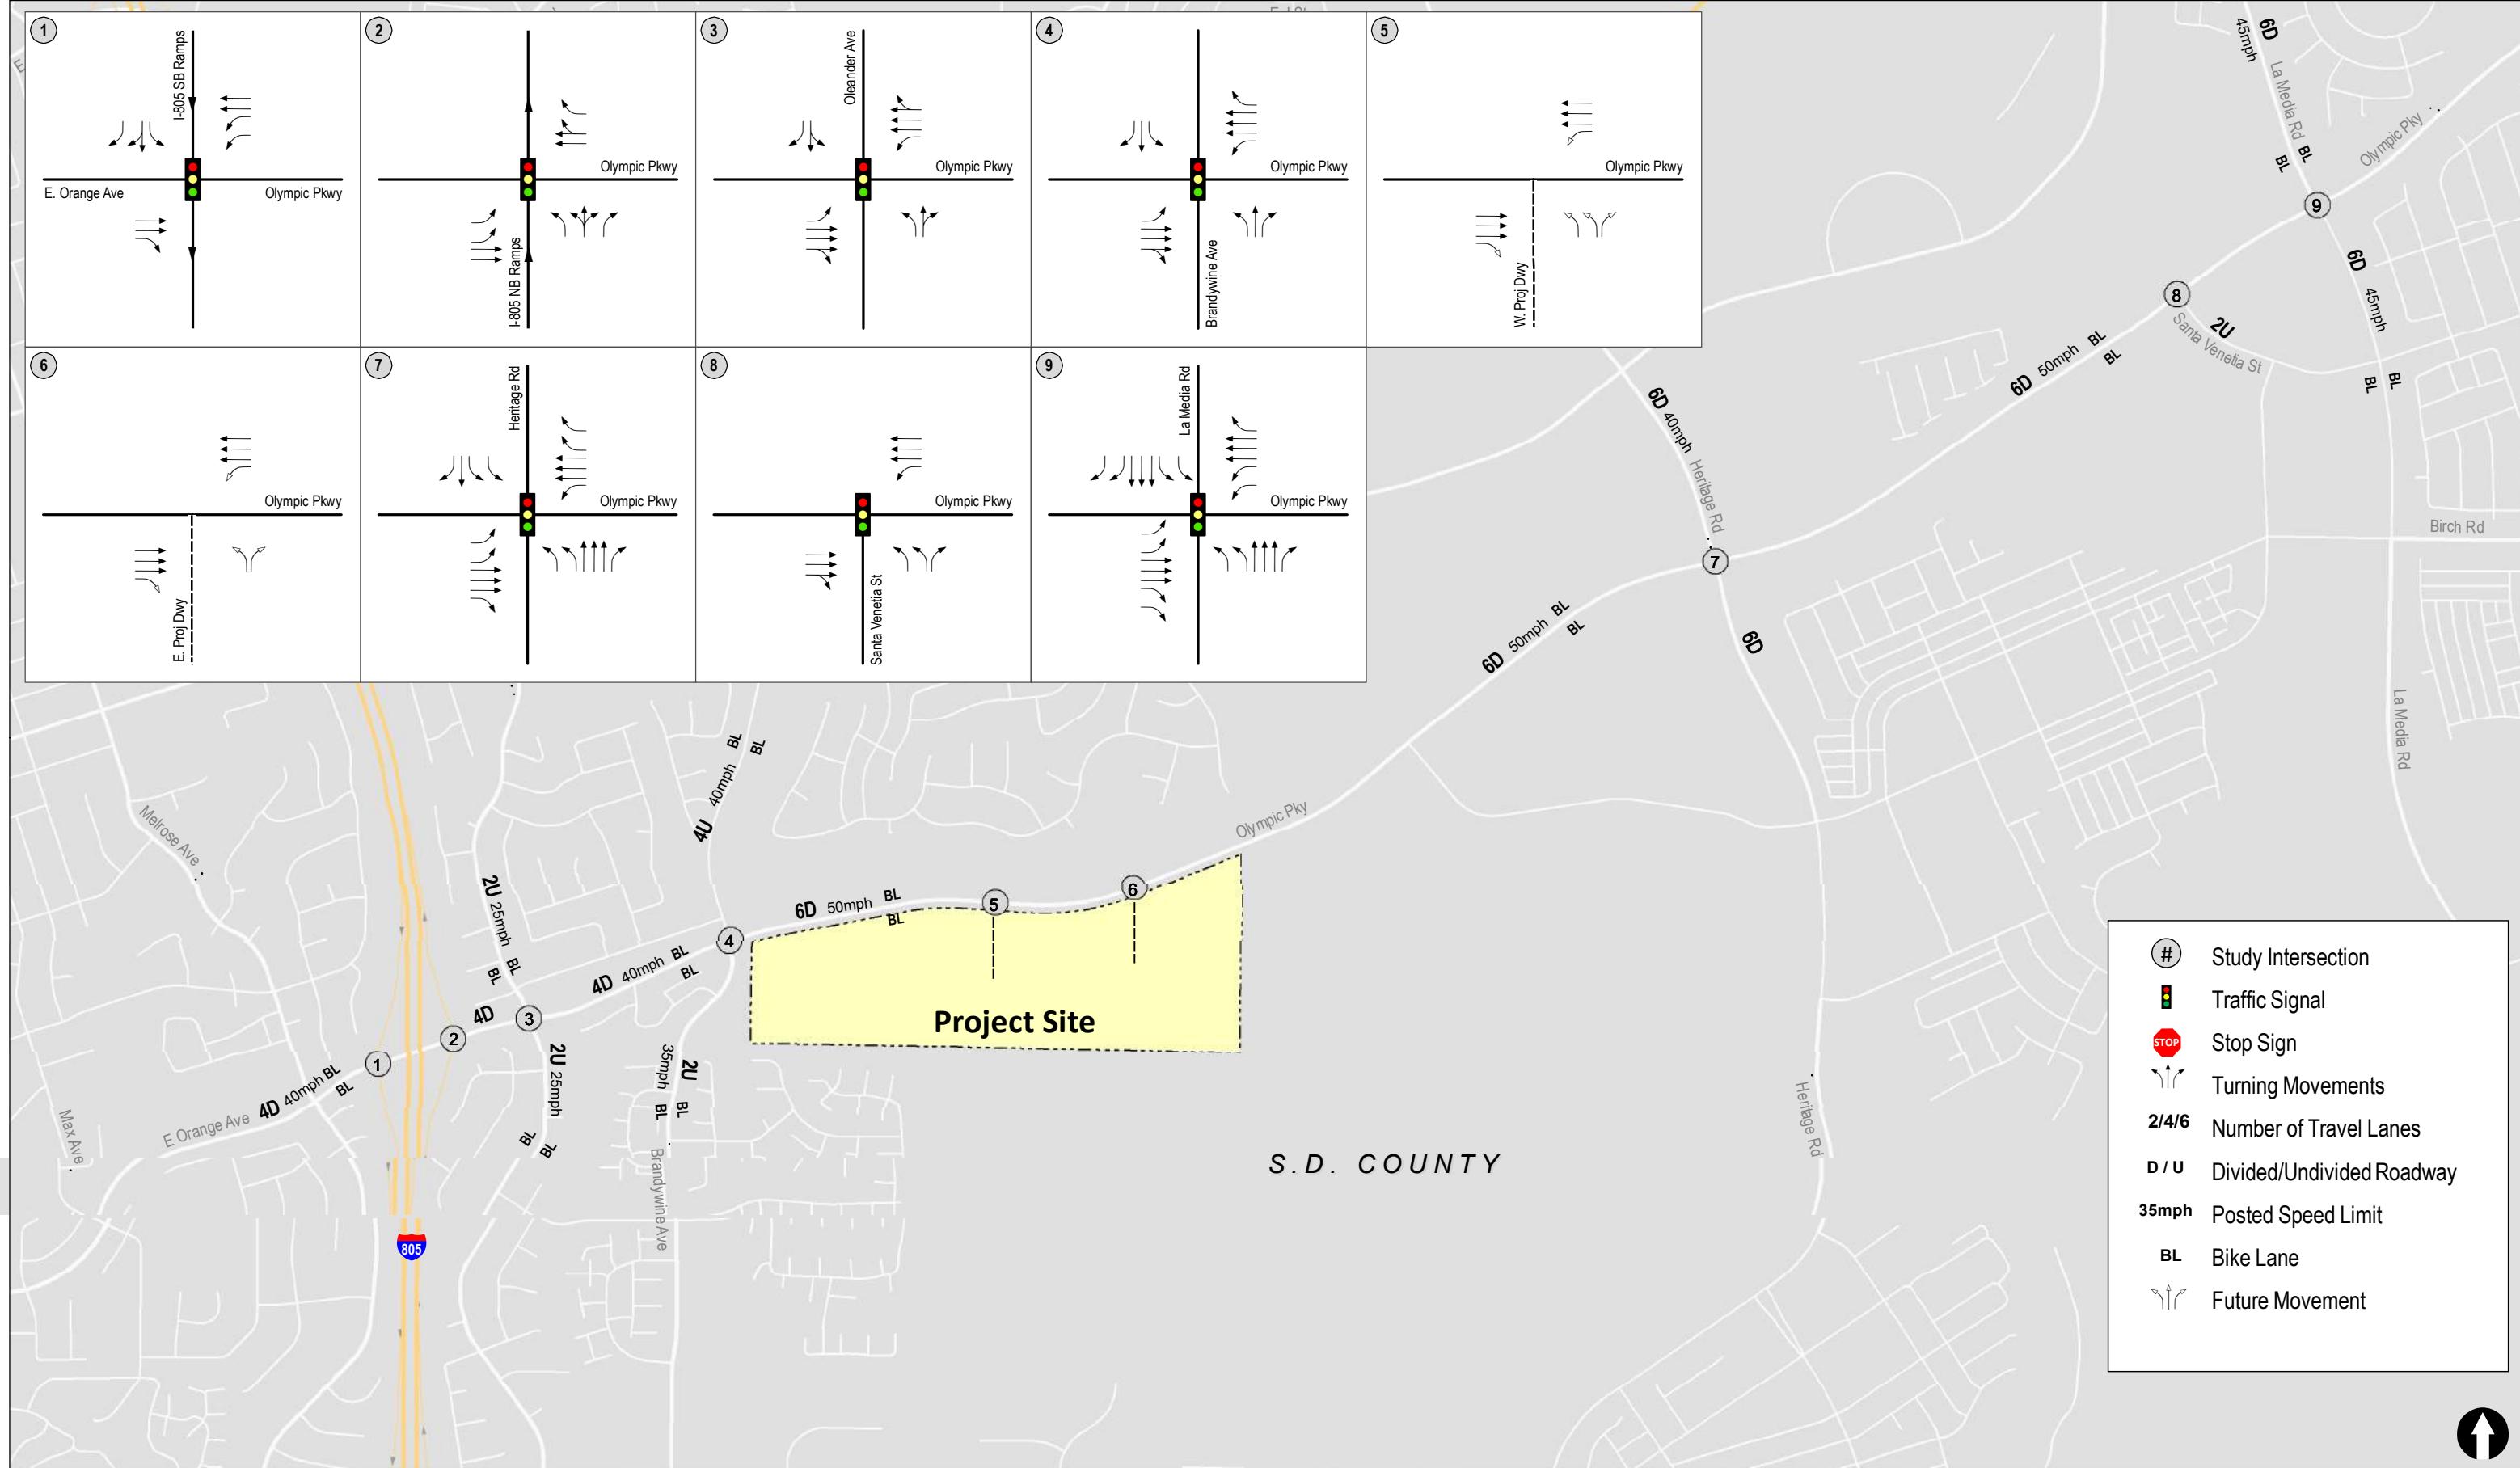

Route 707 currently operates Monday through Friday from 5:02 AM through 7:14 PM departing from Eastlake Parkway & Olympic Parkway and from 6:31 AM through 7:23 PM departing from Southwestern College. Weekday schedules include 30-minute headways. Route 707 does not operate on weekends or observed holidays.

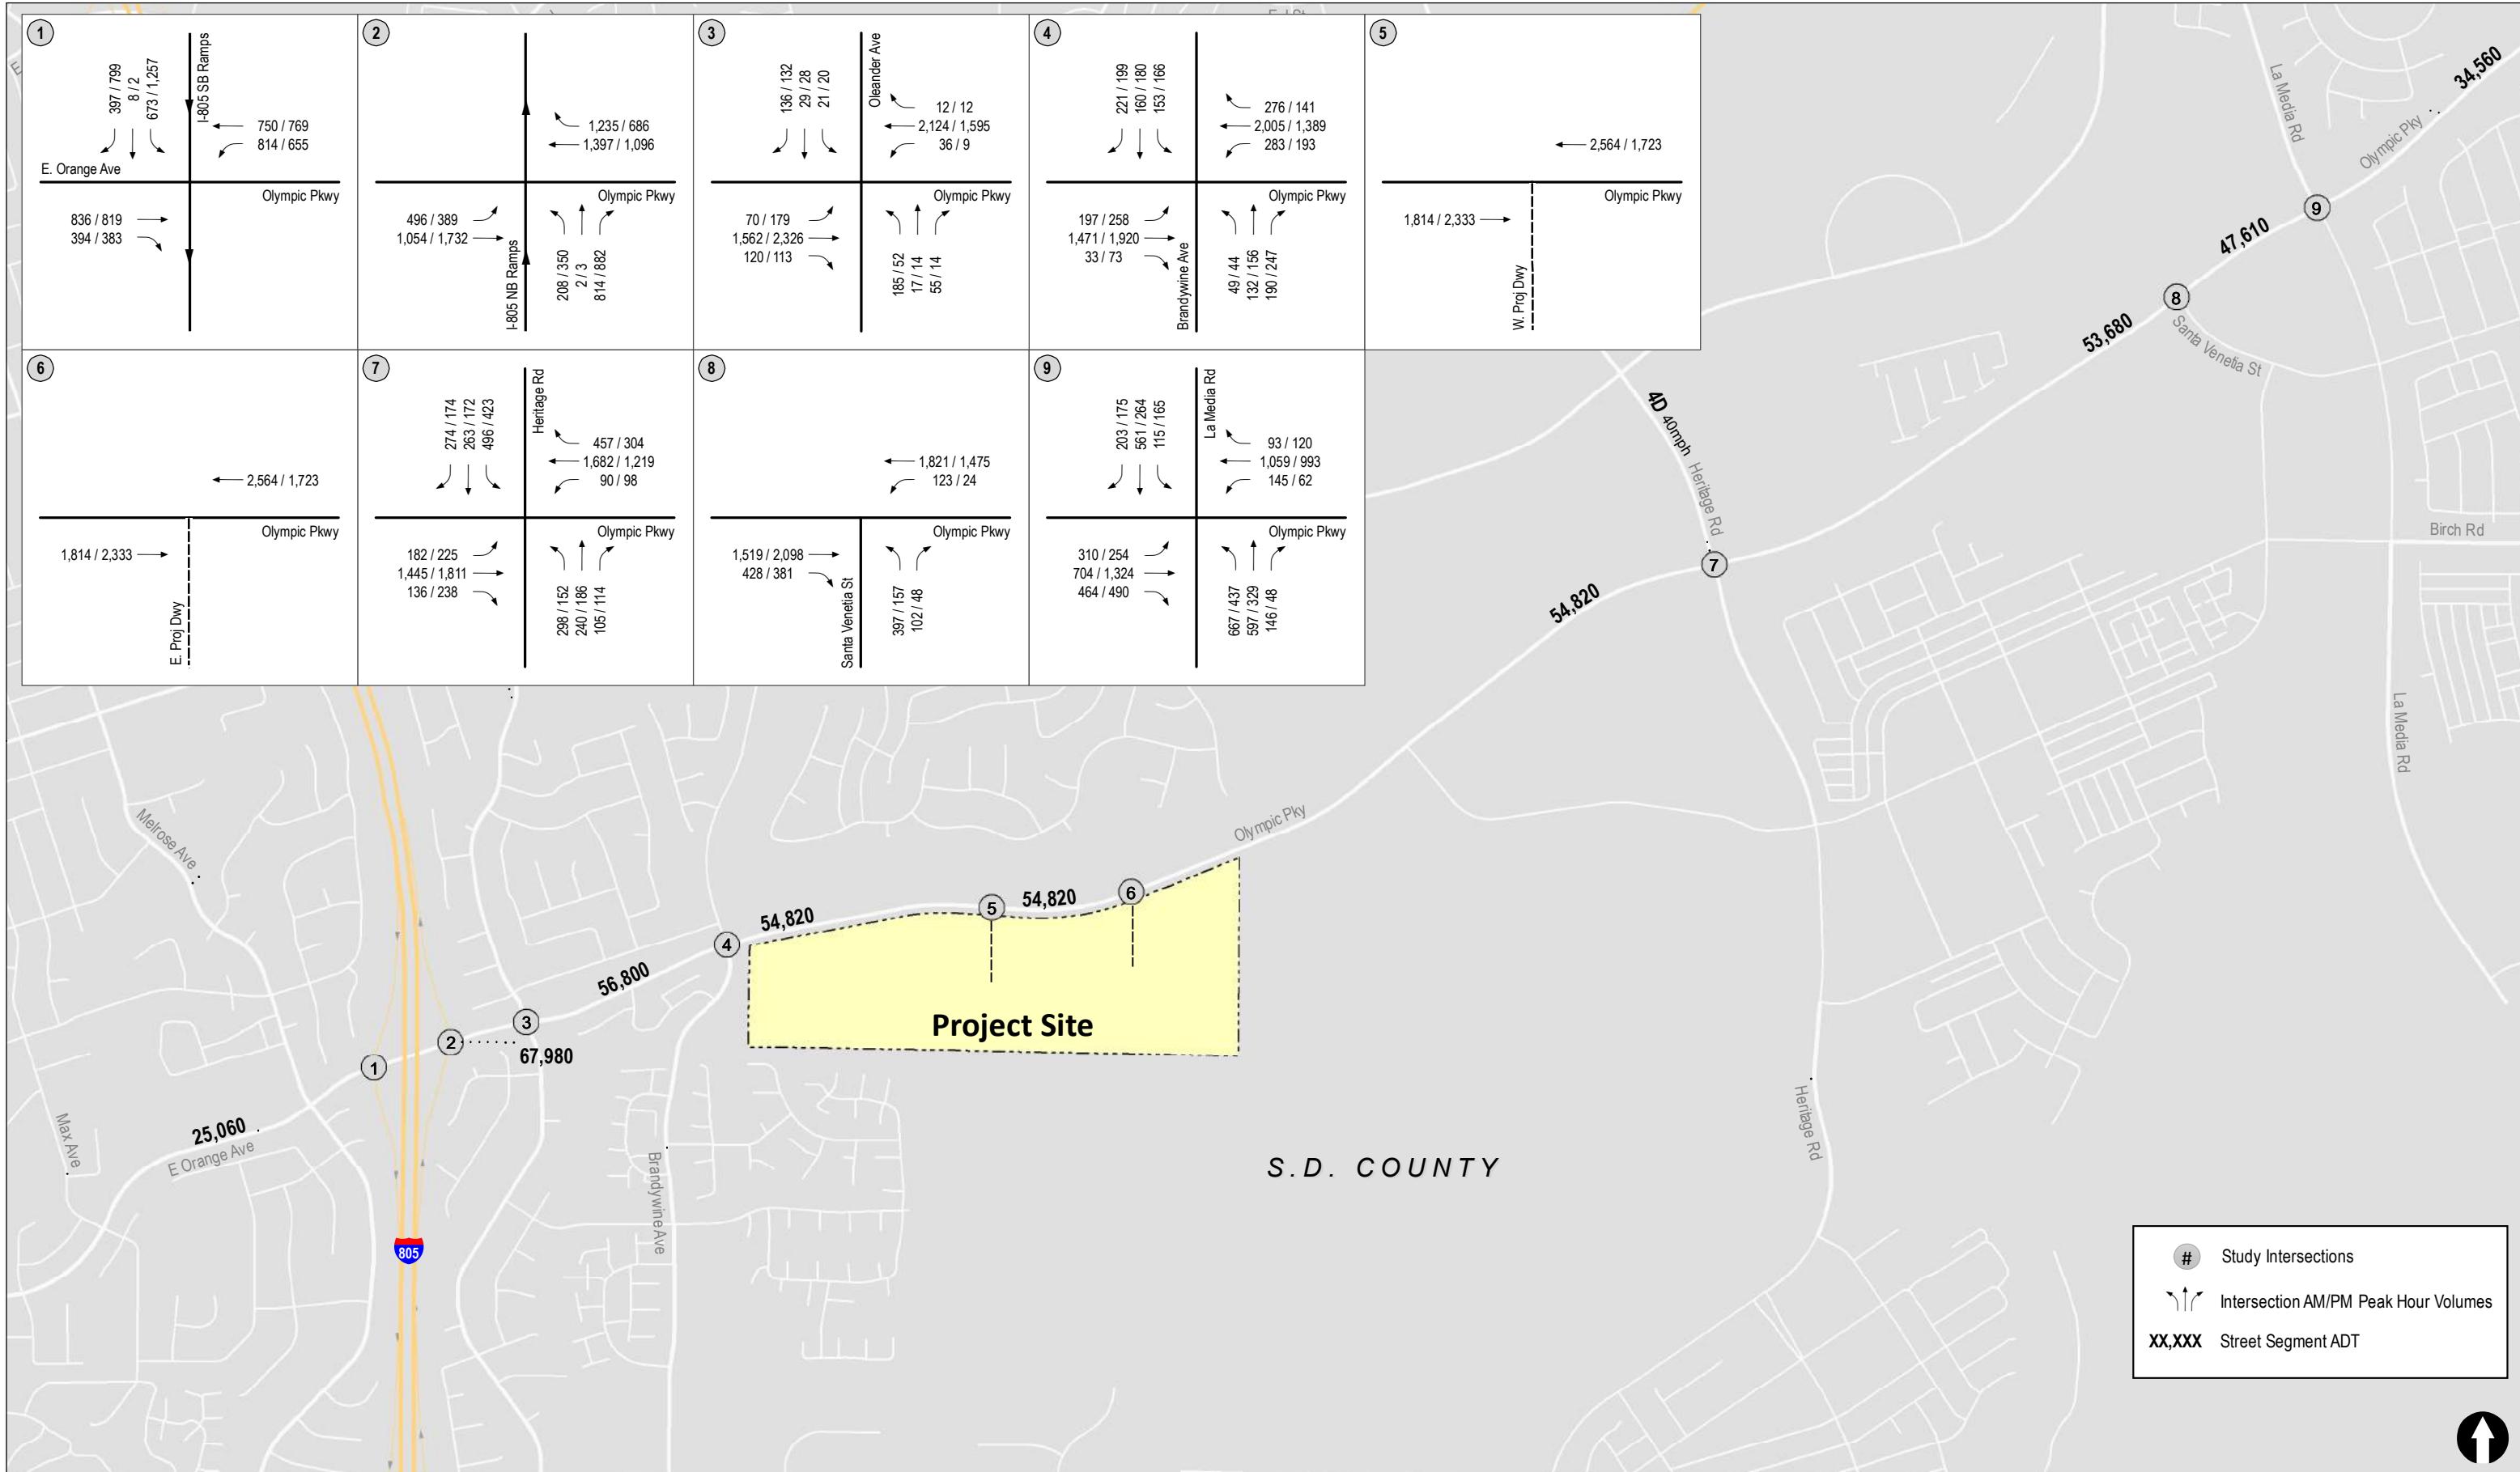

- **Route 709** runs from the H Street Transit Center to Eastlake Parkway & Olympic Parkway via East H Street, East Palomar Street, and La Media Road, as well as other streets that are not near the project study area. There are 22 stops along this route with destinations to Bonita Vista High School, Hilltop High School, Otay Ranch Town Center, Scripps Hospital and Southwestern College.

Route 709 currently operates Monday through Friday from 5:49 AM through 10:22 PM departing from the H Street Transit Center and from 4:52 AM through 10:06 PM departing from Eastlake Parkway & Olympic Parkway. Saturday route schedule begins at 6:22 AM through 9:55 AM departing from the H Street Transit Center and begins at 5:37 AM to 9:37 PM departing from Eastlake Parkway & Olympic Parkway. Sunday schedule begins at 6:51 AM through 8:07 PM departing from the H Street Transit Center and begins at 6:37 AM through 7:50 PM departing from Eastlake Parkway & Olympic Parkway. Route 709 operates on observed holidays with a Saturday or Sunday schedule. Weekday schedules include 30-minute headways. Weekend schedules include 1-hour headways.

- **Route 712** runs from the Palomar Street Transit Center to Southwestern College via Palomar Street and East Palomar Street. There are 26 stops along this route with destinations to Castle Park Middle School, Castle Park High School, Heritage Park, Palomar High School, Sharp Medical Center, and Veterans Park.

Route 712 currently operates Monday through Friday from 5:45 AM through 9:26 PM departing from the Palomar Street Transit Center and from 6:19 AM through 10:09 PM departing from Southwestern College. Saturday route schedule begins at 6:30 AM through 8:30 PM departing from the Palomar Street Transit Center and begins at 6:19 AM to 8:19 PM departing from Southwestern College. Sunday schedule begins at 8:00 AM through 7:00 PM departing from the Palomar Street Transit Center and begins at 6:49 AM through 6:48 PM departing from Southwestern College. Route 712 operates on observed holidays with a Saturday or Sunday schedule. Weekday schedules include 30-minute headways. Weekend schedules include 1-hour headways.

## **9.0 SUBSTANTIAL EFFECT CRITERIA**

Traffic effects will be defined as either project specific effects or cumulative effects. Project specific effects are those effects for which the addition of project trips result in an identifiable degradation in LOS on intersections, triggering the need for specific project-related improvement strategies. Cumulative effects are those in which the project trips contribute to a poor LOS, at a level that falls below the Project-specific effect threshold.

Criteria for determining whether the project results in either project specific or cumulative effects on intersections in the City of Chula Vista are as follows:

### **9.1 Short-Term (Study Horizon Year 0 To 4)**

#### **9.1.1 *Intersections***

- a. Project specific effect if both the following criteria are met:
  - i. Level of service is LOS E or LOS F.
  - ii. Project trips comprise 5% or more of entering volume.
- b. Cumulative effect if only (i) is met.

#### **9.1.2 *Street Links/Segments***

If the planning analysis using the volume to capacity ratio indicates LOS C or better, there is no effect. If the planning analysis indicates LOS D, E, or F, the GMOC method shall be utilized. The following criteria would then be utilized.

- a. Project specific effect if all the following criteria are met:
  - i. Level of service is LOS D for more than 2 hours or LOS E/F for 1 hour
  - ii. Project trips are 5% or more of segment volume
  - iii. Project adds greater than 800 ADT to the segment
- b. Cumulative effect if only (i) is met.

### **9.2 Long-Term (Study Horizon Year 5 and Later)**

#### **9.2.1 *Intersections***

- a. Project specific effect if all the following criteria are met:
  - i. Level of service is LOS E or LOS F.
  - ii. Project trips comprise 5% or more of entering volume.
- b. Cumulative effect if only (i) is met.

#### **9.2.2 *Street Links/Segments***

Use the planning analysis using the volume to capacity ratio methodology only. The GMOC analysis methodology is not applicable beyond a four-year horizon.

- a. Project specific effect if all the following criteria are met:
  - i. Level of service is LOS D, E or F.
  - ii. Project trips are 5% or more of segment volume
  - iii. Project adds greater than 800 ADT to the segment

- b. Cumulative effect if only (i) is met. However, if the intersections along a LOS D or LOS E segment all operate at LOS D or better, the segment effect is considered not substantial since intersection analysis is more indicative of actual roadway system operations than street segment analysis. If segment Level of Service is LOS F, effect is substantial regardless of intersection LOS.

## 10.0 ANALYSIS OF EXISTING CONDITIONS

### 10.1 Peak Hour Intersection Analysis

**Table 10–1** summarizes the peak hour intersection operations under Existing conditions in the study area. As shown, the study area intersections are calculated to currently operate acceptably at LOS D or better during the AM and PM peak hours, with the exception of the following:

- Olympic Parkway / I-805 Southbound Ramps (LOS F during the PM peak hour)
- Olympic Parkway / I-805 Northbound Ramps (LOS F during the AM peak hour)

**Appendix B** contains the Existing intersection analysis worksheets.

### 10.2 Daily Street Segment Operations

**Table 10–2** summarizes the Existing street segment operations along the key study area roadways. As shown, the study area street segments are calculated to currently operate acceptably at LOS C or better, with the exception of the following:

- Olympic Parkway: I-805 Ramps to Oleander Avenue (LOS F)
- Olympic Parkway: Oleander Avenue to Brandywine Avenue (LOS E)
- Olympic Parkway: Brandywine Avenue to Project Driveway (West) (LOS D)
- Olympic Parkway: Project Driveway (West) to Project Driveway (East) (LOS D)
- Olympic Parkway: Project Driveway (East) to Heritage Road (LOS D)
- Olympic Parkway: Heritage Road to Santa Venetia Street (LOS D)

**TABLE 10-1**  
**EXISTING INTERSECTION OPERATIONS**

Intersection	Control Type	Peak Hour	Existing	
			Delay <sup>a</sup>	LOS <sup>b</sup>
1. Olympic Parkway/ I-805 Southbound Ramps	Signal	AM	43.6	D
		PM	87.3	F
2. Olympic Parkway / I-805 Northbound Ramps	Signal	AM	>100	F
		PM	45.6	D
3. Olympic Parkway / Oleander Avenue	Signal	AM	26.6	C
		PM	7.2	A
4. Olympic Parkway / Brandywine Avenue	Signal	AM	43.6	D
		PM	32.8	C
5. Olympic Parkway / Project Driveway (West)	DNE <sup>c</sup>	AM	-	-
		PM	-	-
6. Olympic Parkway / Project Driveway (East)	DNE <sup>c</sup>	AM	-	-
		PM	-	-
7. Olympic Parkway / Heritage Road	Signal	AM	45.8	D
		PM	36.2	D
8. Olympic Parkway / Santa Venetia Street	Signal	AM	14.4	B
		PM	8.2	A
9. Olympic Parkway / La Media Road	Signal	AM	53.5	D
		PM	39.1	D

**Footnotes:**

- b. Average delay expressed in seconds per vehicle.
- c. Level of Service.
- d. Intersection does not exist under Existing conditions

SIGNALIZED	
DELAY/LOS THRESHOLDS	
Delay	LOS
0.0 ≤ 10.0	A
10.1 to 20.0	B
20.1 to 35.0	C
35.1 to 55.0	D
55.1 to 80.0	E
≥ 80.1	F

**TABLE 10-2**  
**EXISTING STREET SEGMENT OPERATIONS**

<b>Street Segment</b>	<b>Functional Classification</b>	<b>Capacity (LOS C)<sup>a</sup></b>	<b>Existing</b>	
			<b>ADT<sup>b</sup></b>	<b>LOS<sup>c</sup></b>
<b>Olympic Parkway</b>				
West of I-805 Ramps	4-Lane Major	30,000	25,060	B
I-805 Ramps to Oleander Avenue	6-Lane Prime	50,000	<b>67,980</b>	F
Oleander Avenue to Brandywine Avenue	6-Lane Prime	50,000	<b>56,800</b>	E
Brandywine Avenue to Project Driveway (West)	6-Lane Prime	50,000	<b>54,820</b>	D

- b. Average Daily Traffic Volumes.
- c. Level of Service.

## 11.0 TRIP GENERATION/DISTRIBUTION/ASSIGNMENT

### 11.1 Trip Generation

Trip generation rates were obtained from the (Not So) *Brief guide of Vehicular Traffic Generation Rates for the San Diego Region*, April 2002 by SANDAG. The trip rates for Condominiums were used to estimate the Project trip generation.

The proposed Project currently includes the construction of 718-multi-family units. However, the analysis conducted for the Project's Local Mobility assessment assumes 720-multi-family units. This is a conservative approach as it assumes two additional dwelling units as compared to the currently proposed Project.

**Table 11-1** summarizes the trip generation for the Project, assuming 720-multi-family units. As shown in *Table 11-1*, the Project is calculated to generate 5,760 daily trips with a total of 461 trips during the AM peak hour (92 inbound/ 369 outbound trips) and 576 trips during PM peak hour (403 inbound/ 173 outbound trips).

TABLE 11-1  
PROJECT TRIP GENERATION

Use	Quantity	Daily Trip Ends (ADTS) <sup>a</sup>		AM Peak Hour				PM Peak Hour			
		Rate <sup>b</sup>	Volume	% of ADT	In:Out Split	Volume		% of ADT	In:Out Split	Volume	
						In	Out			In	Out
Condominiums	720 Units	8 / Unit	5,760	8%	20:80	92	369	10%	70:30	403	173

*Footnotes:*

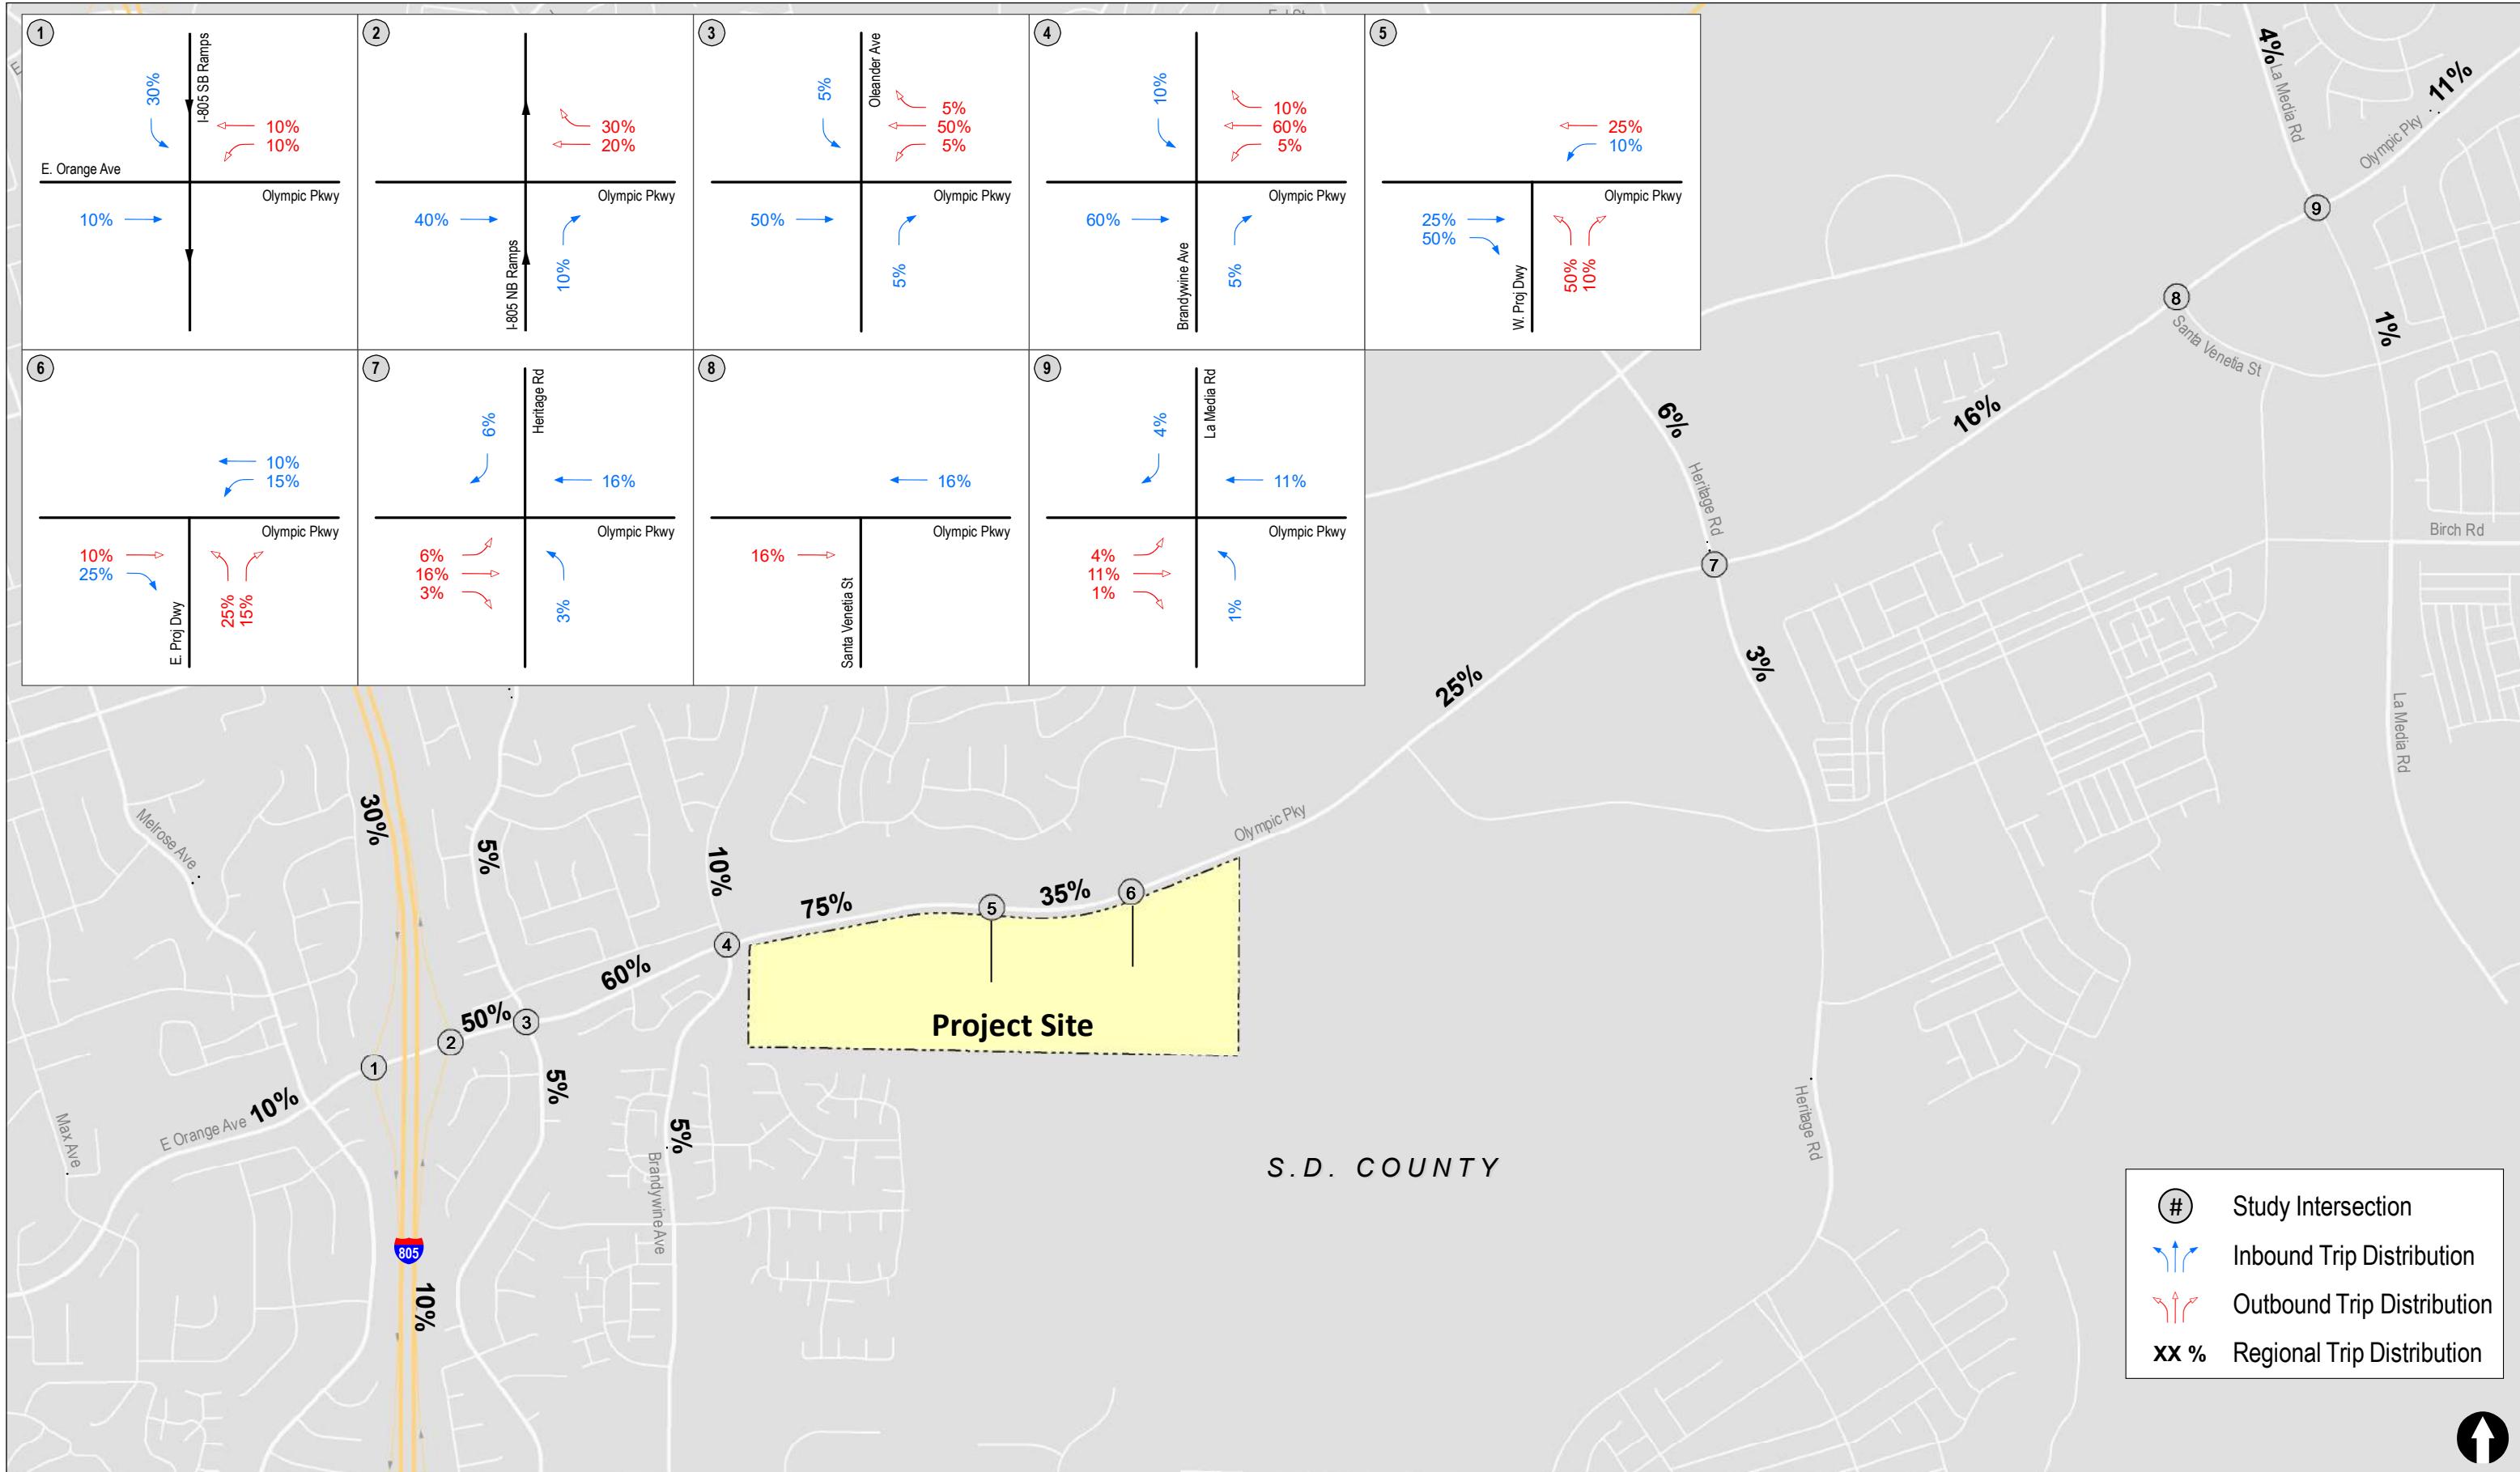

- a. Average Daily Trips
- b. Trip Generation Rate from the SANDAG's *Not So Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region*, 2002.

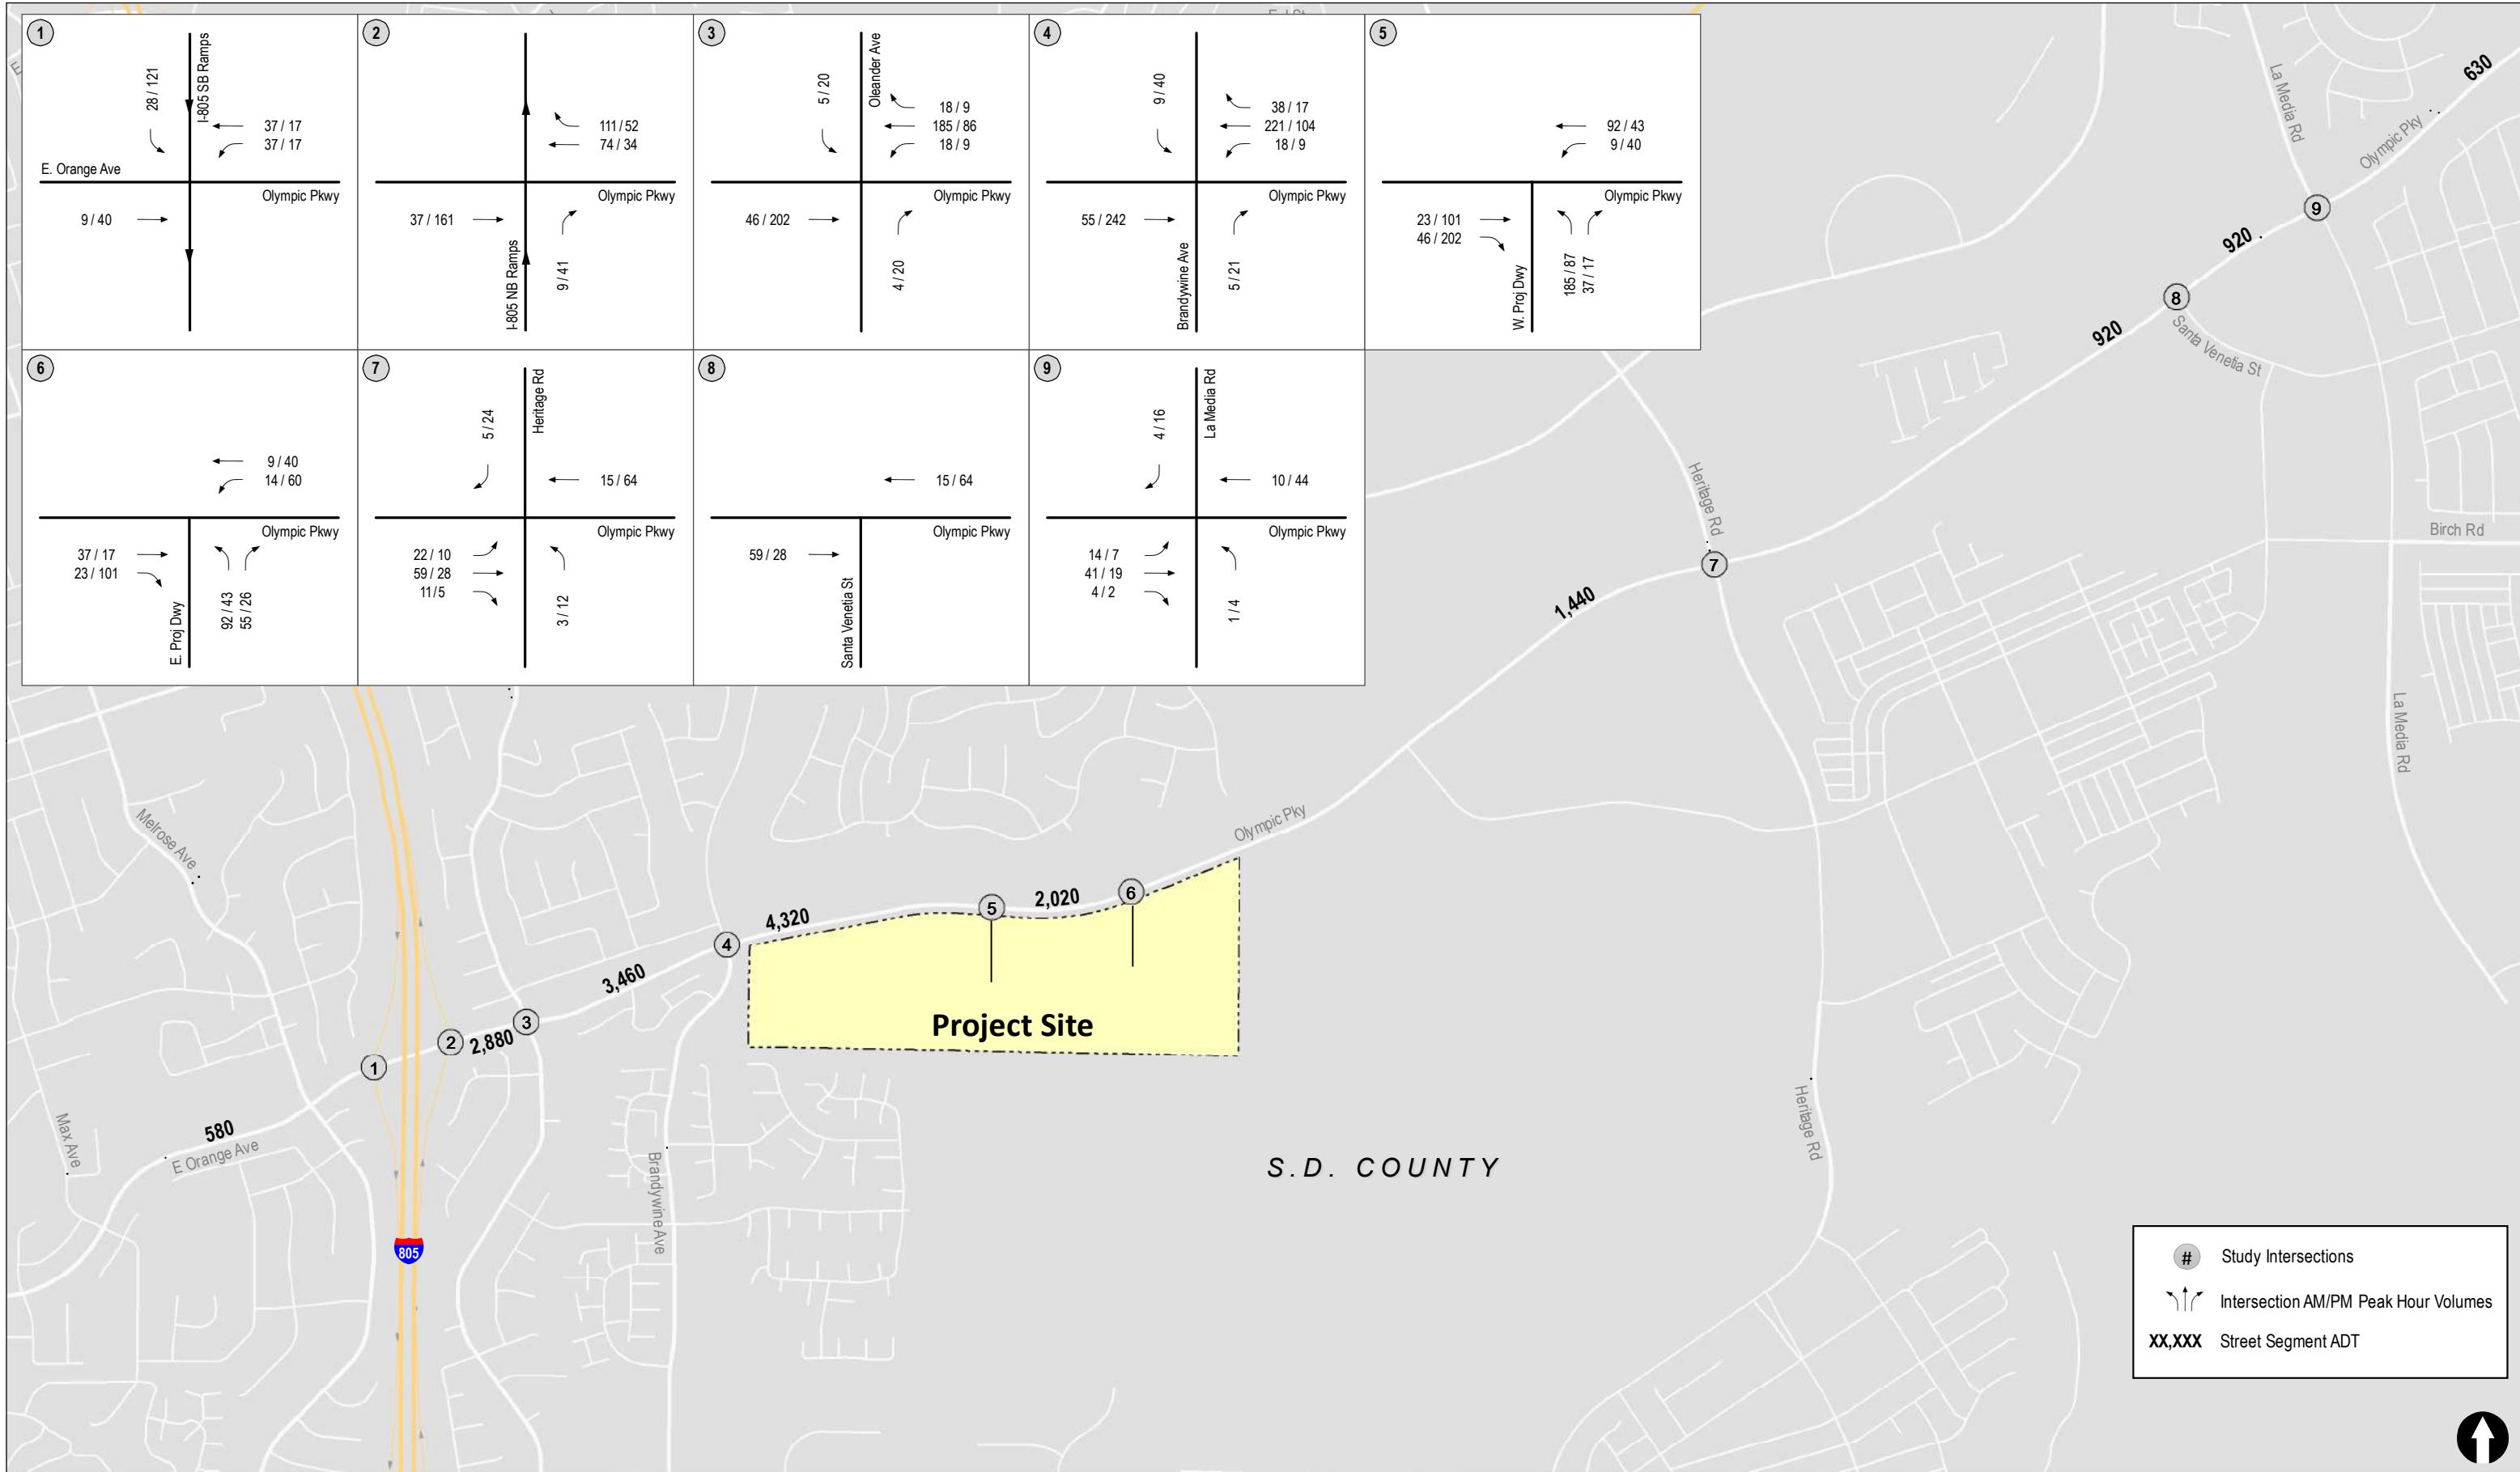

### 11.2 Trip Distribution and Assignment

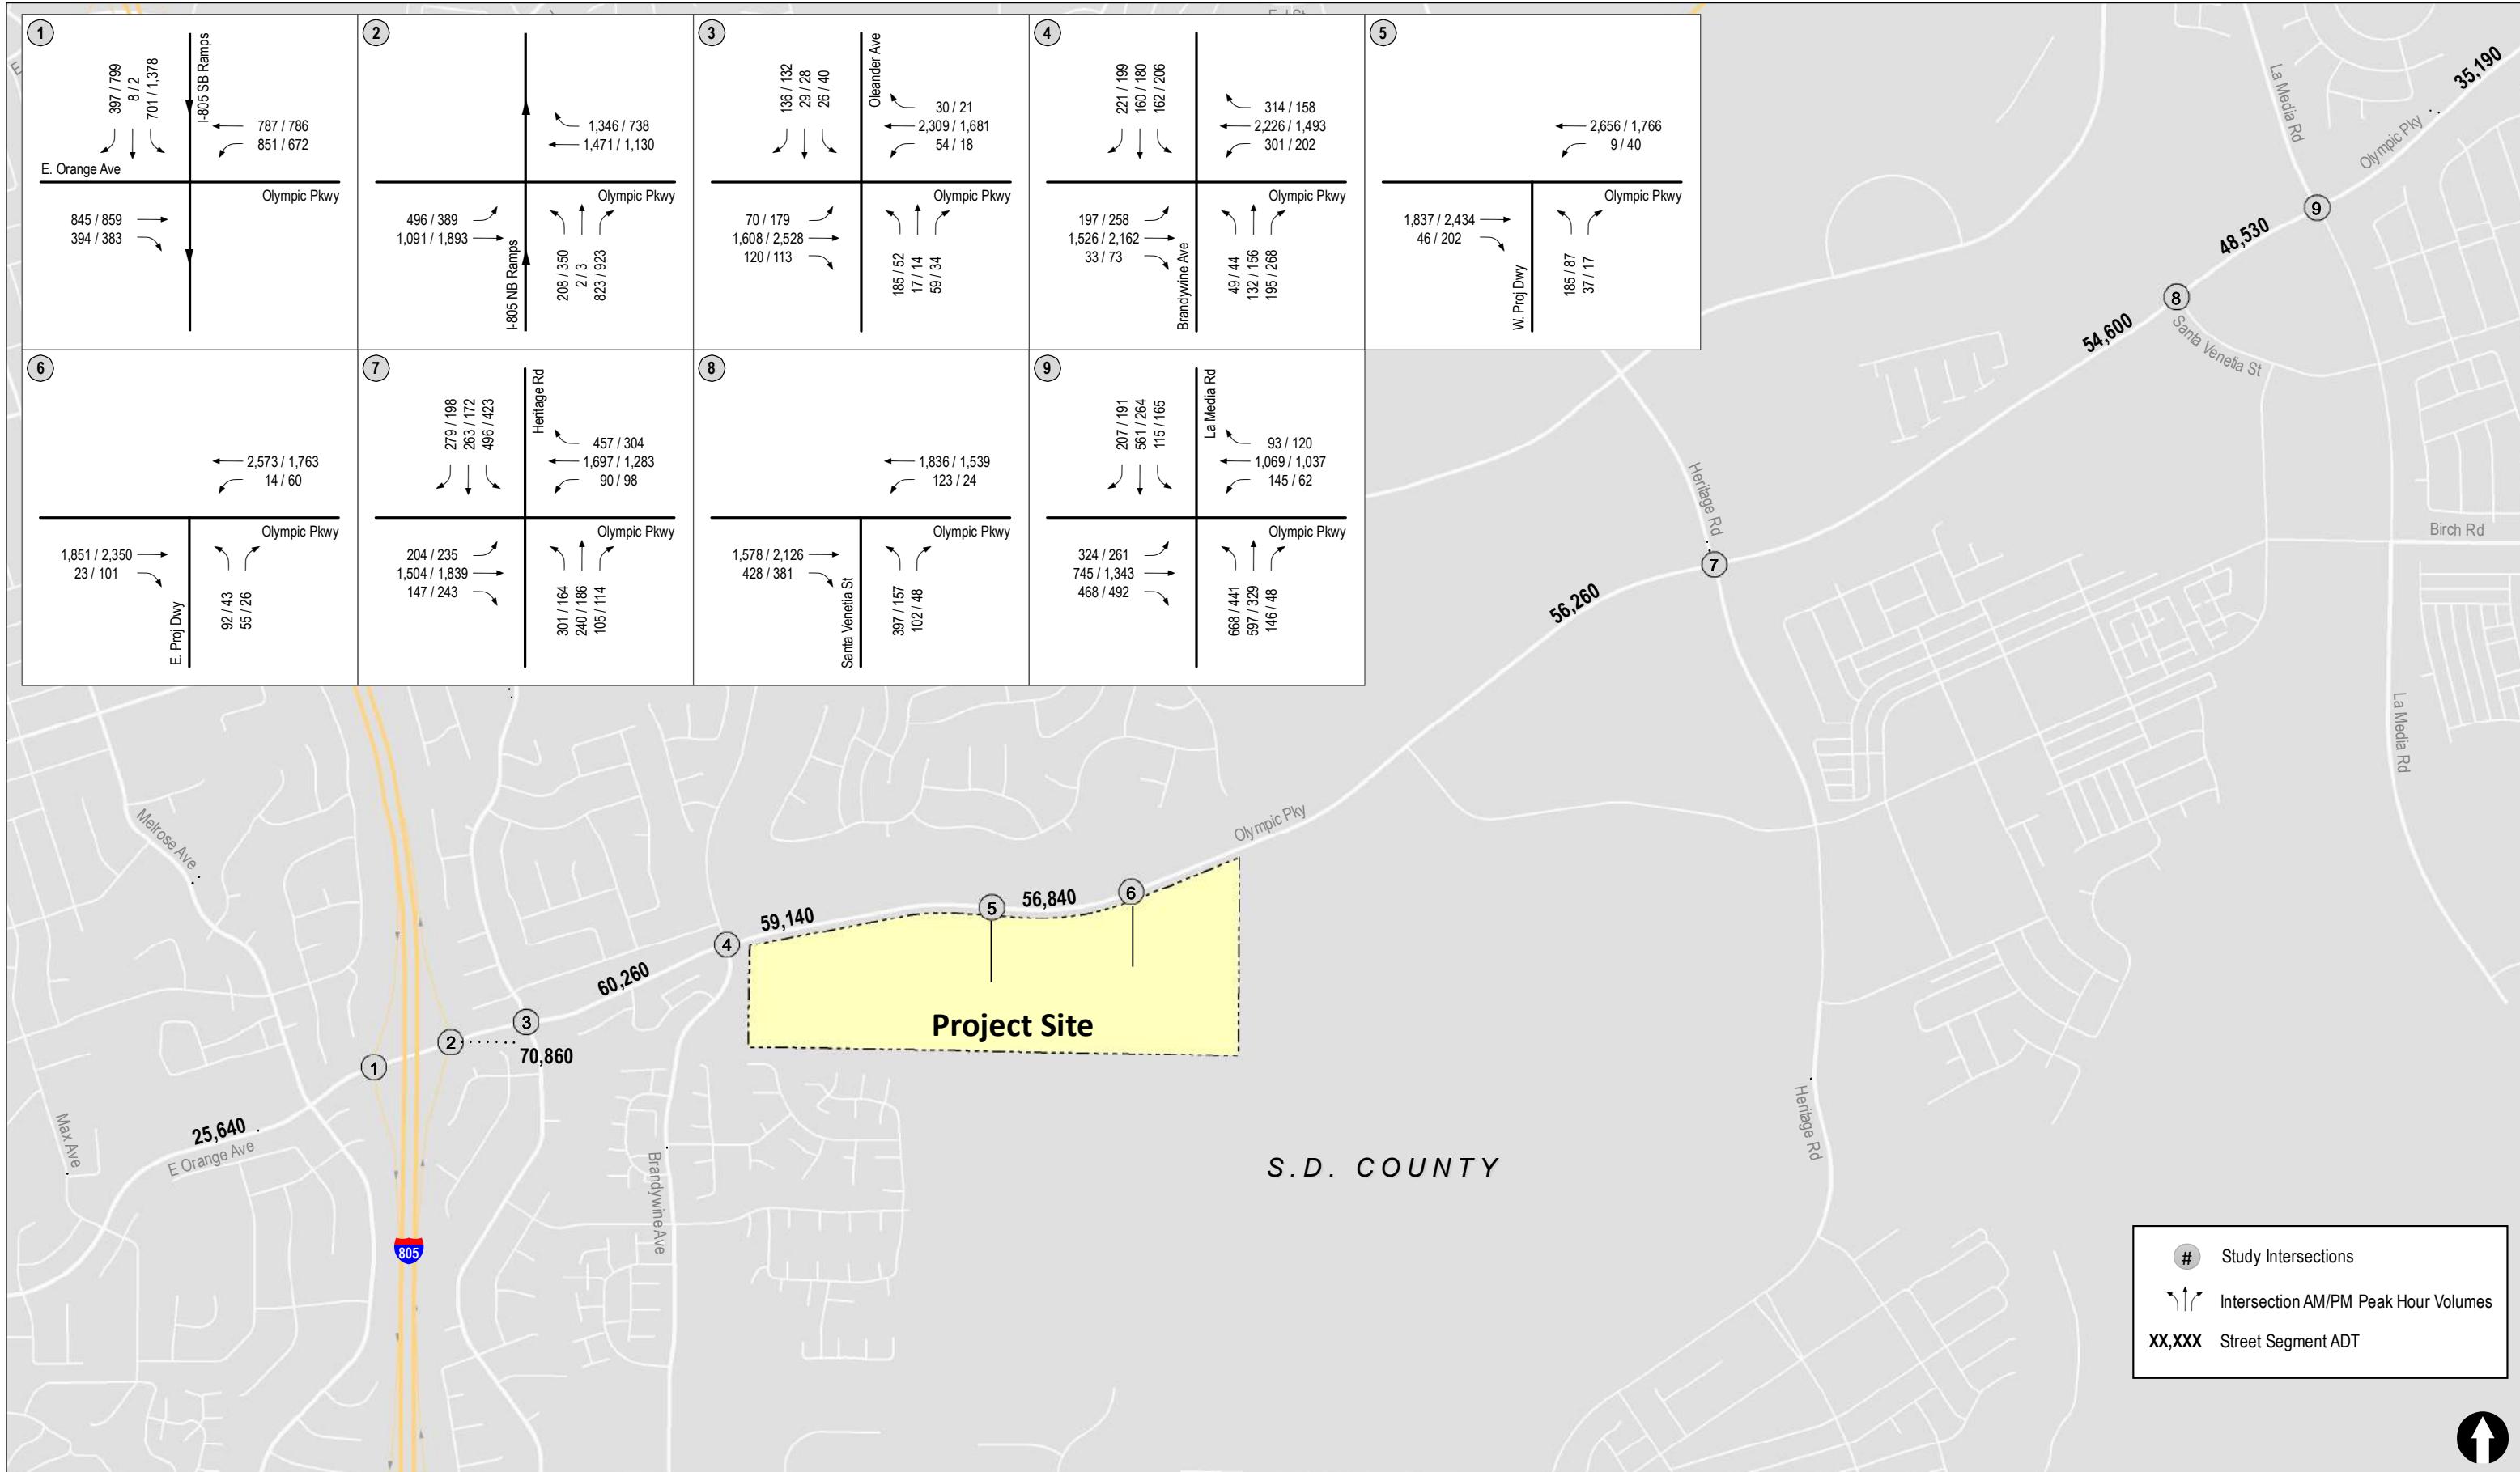

A Project-specific SANDAG Select Zone model was used to estimate the Project's distribution with adjustments made to account for the locations of the proposed access points, traffic patterns observed from the existing traffic counts, and the locations of employment centers and retail opportunities.

**Figure 11-1** shows the distribution of the Project trips. **Figure 11-2** shows the Project traffic volumes. **Figure 11-3** shows the Existing with Project traffic volumes.

The unadjusted SANDAG Select Zone model run is included in **Appendix F**.

## 12.0 ANALYSIS OF EXISTING + PROJECT CONDITIONS

### 12.1 Peak Hour Intersection Analysis

**Table 12-1** summarizes the peak hour intersection operations under Existing + Project conditions in the study area. As shown, the study area intersections are calculated to continue to operate acceptably at LOS D or better during the AM and PM peak hours, with the exception of the following:

- Olympic Parkway / I-805 Southbound Ramps (LOS F during the PM peak hour)
- Olympic Parkway / I-805 Northbound Ramps (LOS F during the AM peak hour)

The Project contributes less than 5% of traffic to these locations. ***Therefore, the Project effects are considered substantial cumulative effects.***

**Appendix C** contains the Existing + Project intersection analysis worksheets.

### 12.2 Daily Street Segment Operations

**Table 12-2** summarizes the Existing + Project street segment operations along the key study area roadways. As shown, the study area street segments are calculated to continue to operate acceptably at LOS C or better, with the exception of the following:

- Olympic Parkway: I-805 Ramps to Oleander Avenue (LOS F)
- Olympic Parkway: Oleander Avenue to Brandywine Avenue (LOS E)
- Olympic Parkway: Brandywine Avenue to Project Driveway (West) (LOS E)
- Olympic Parkway: Project Driveway (West) to Project Driveway (East) (LOS E)
- Olympic Parkway: Project Driveway (East) to Heritage Road (LOS D)
- Olympic Parkway: Heritage Road to Santa Venetia Street (LOS D)

The Project contributes more than 800 ADT, but less than 5% of traffic to the following locations.

***Therefore, the Project effects are considered substantial cumulative effects.***

- Olympic Parkway: I-805 Ramps to Oleander Avenue
- Olympic Parkway: Project Driveway (West) to Project Driveway (East)
- Olympic Parkway: Project Driveway (East) to Heritage Road
- Olympic Parkway: Heritage Road to Santa Venetia Street

The Project contributes more than 800 ADT and more than 5% of traffic to the following location.

***Therefore, the Project effects are considered substantial project specific effects.***

- Olympic Parkway: Oleander Avenue to Brandywine Avenue
- Olympic Parkway: Brandywine Avenue to Project Driveway (West)

**TABLE 12-1**  
**EXISTING WITH PROJECT INTERSECTION OPERATIONS**

Intersection	Control Type	Peak Hour	Existing		Existing with Project		Project % of Entering Volume (>5%)	Effect Type
			Delay <sup>a</sup>	LOS <sup>b</sup>	Delay	LOS		
1. Olympic Parkway / I-805 Southbound Ramps	Signal	AM	43.6	D	44.1	D	2.8%	<b>Cumulative</b>
		PM	<b>87.3</b>	F	<b>92.5</b>	F	4.0%	
2. Olympic Parkway / I-805 Northbound Ramps	Signal	AM	<b>&gt;100</b>	F	<b>&gt;100</b>	F	4.2%	<b>Cumulative</b>
		PM	45.6	D	49.3	D	5.3%	
3. Olympic Parkway / Oleander Avenue	Signal	AM	26.6	C	28.0	C	5.9%	None
		PM	7.2	A	7.4	A	7.1%	
4. Olympic Parkway / Brandywine Avenue	Signal	AM	43.6	D	43.6	D	6.3%	None

## 13.0 CUMULATIVE PROJECTS

### 13.1 Summary of Cumulative Projects

Cumulative projects are other projects in the study area that will add traffic to the local circulation system in the near future. Based on information from City of Chula Vista staff, the following projects were identified for inclusion in the near-term cumulative analysis. The following is a brief description of each of the cumulative projects in the general vicinity of the Project. **Table 13-1** provides additional information on the cumulative projects' land uses and density at buildout.

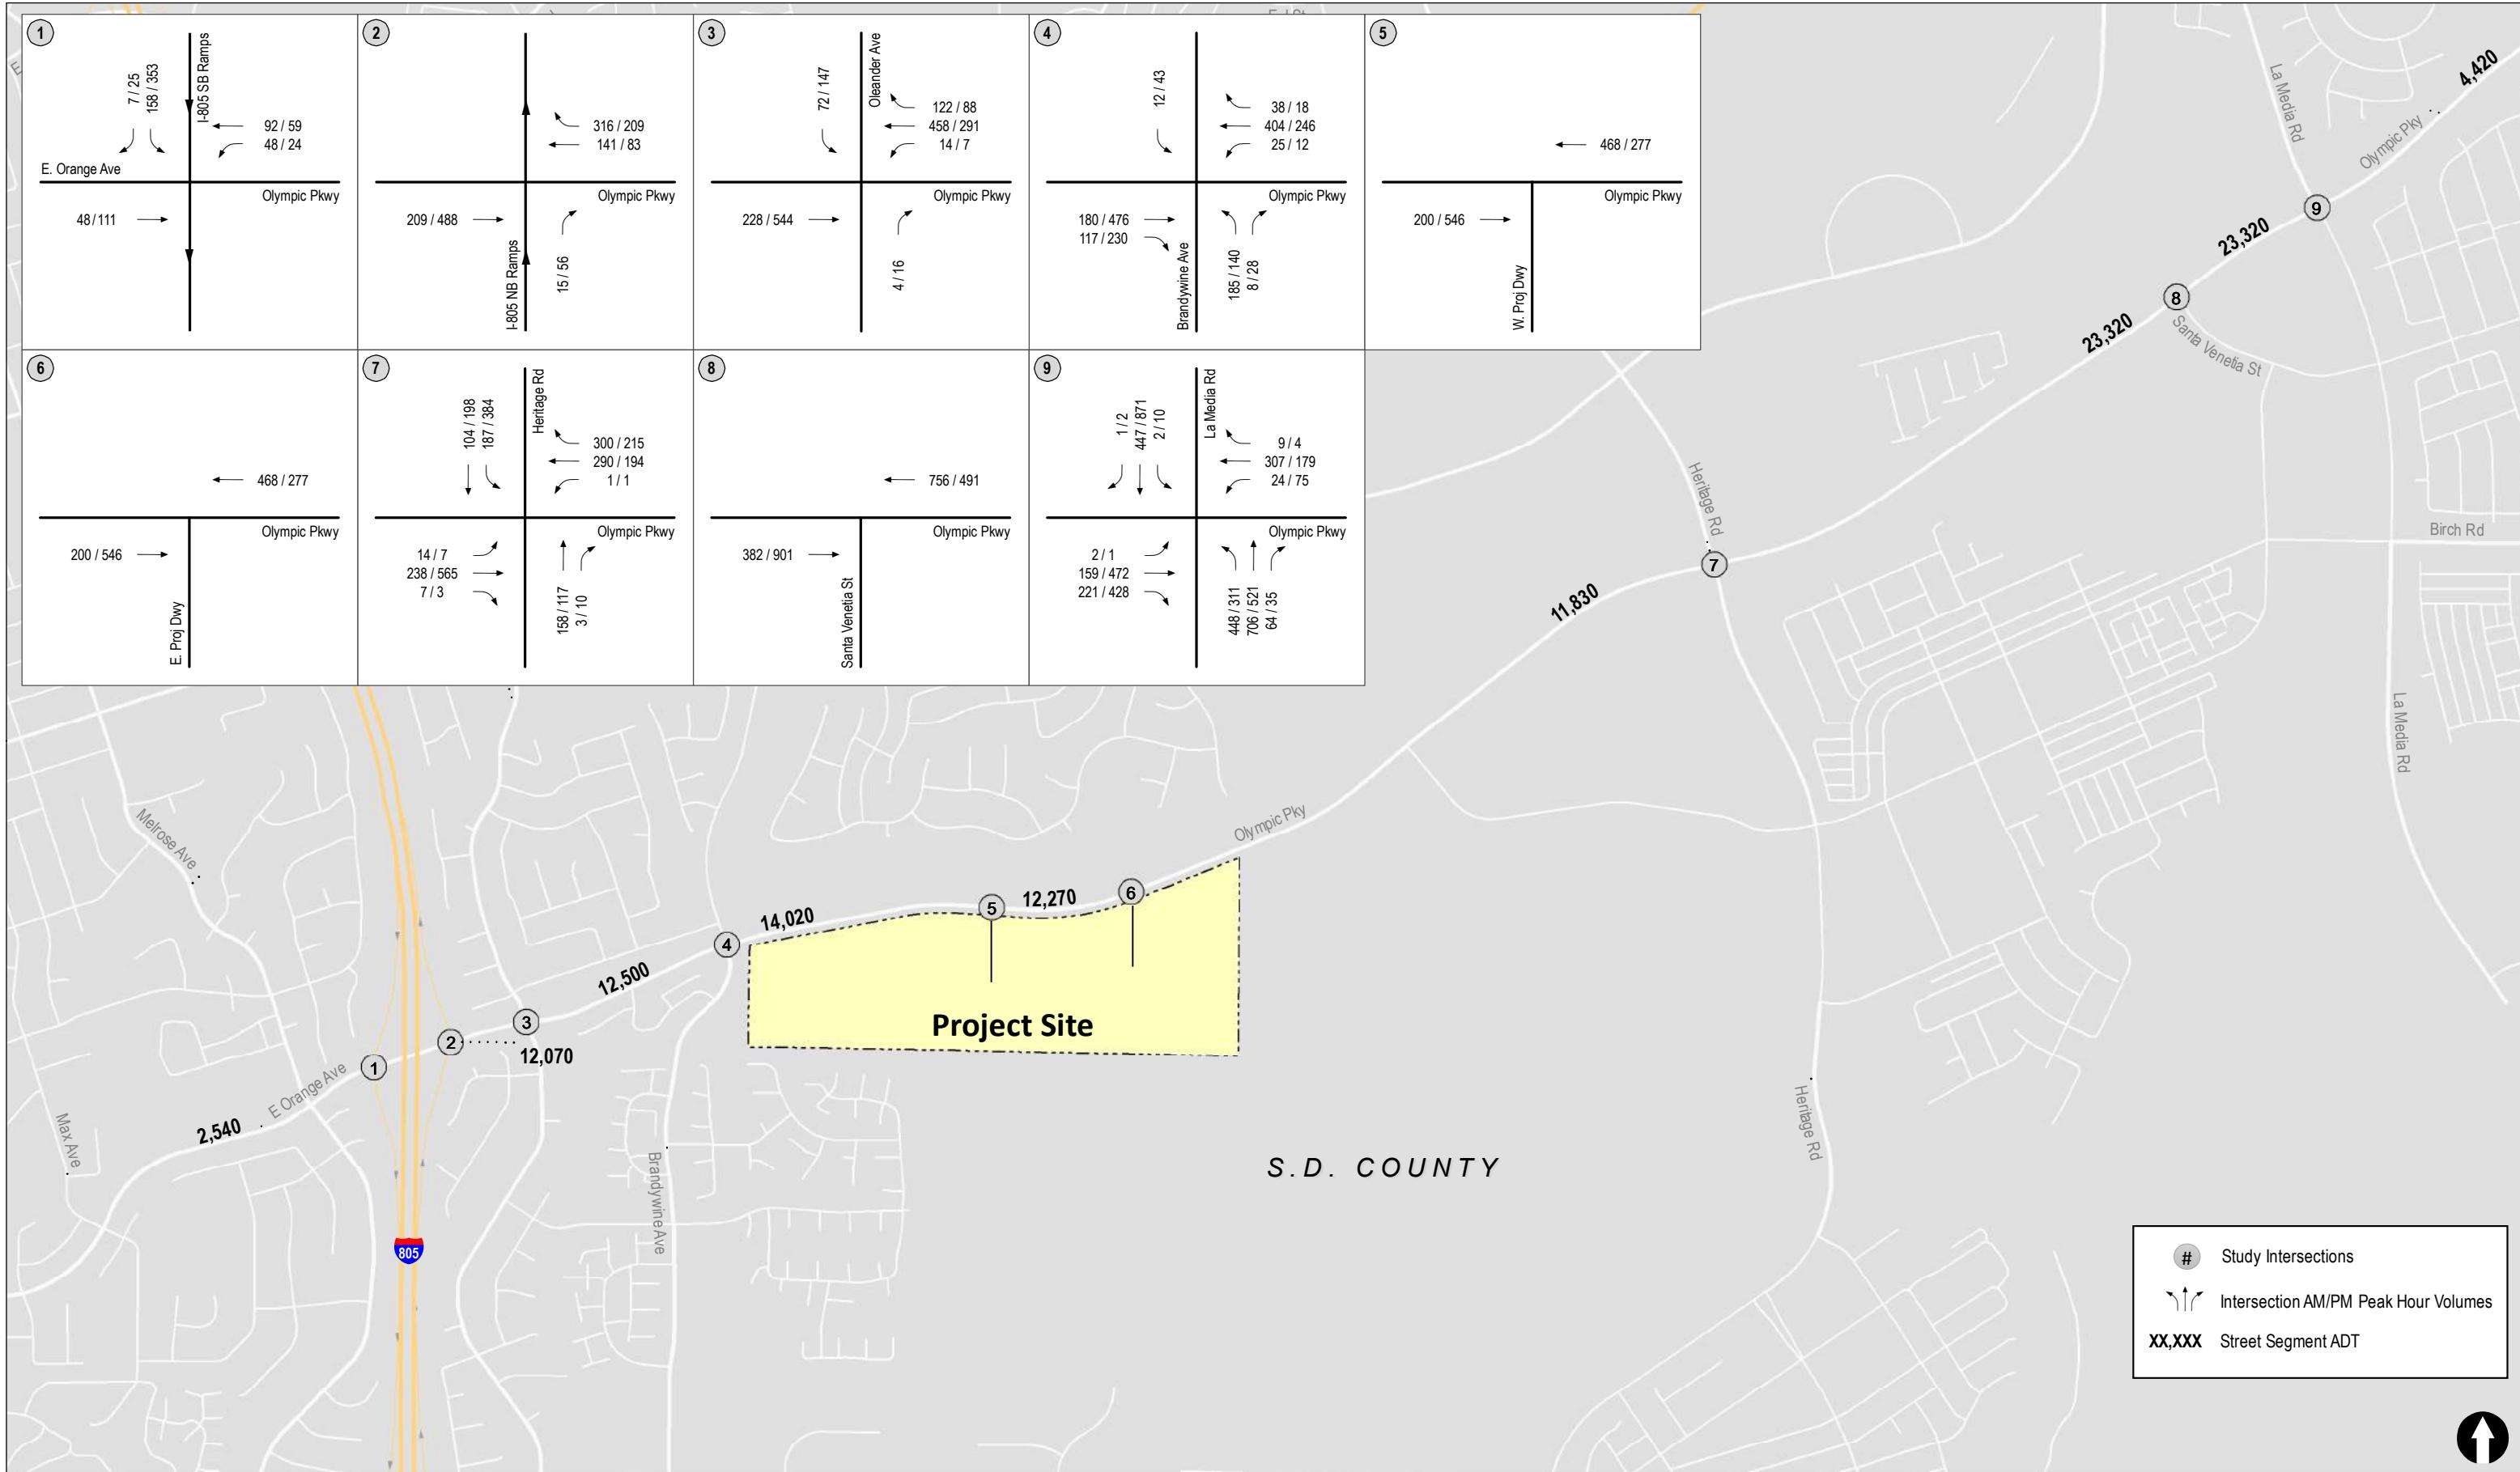

1. **University Villages** project encompasses Village Three North and a Portion of Village Four, Village Eight East, and Village Ten. The development program for the project is based on the Chula Vista General Plan and the approved Otay Ranch planning documents (Otay Ranch GDP, Overall Design Plan, and other SPA plans for Otay Ranch).
2. **Eastern Urban Center (Millenia)** project site is located east of SR 125 and west of Eastlake Parkway, south of Birch Street. Designated uses and density at buildout of the project include 2,983 multi-family residential units, regional and specialty shopping, multi-use cultural arts facilities, local parks, business parks, visitor commercial, a transit station, an elementary school, and other civic facilities.
3. **Village 4 South Residential** project site is planned to be located west of the future La Media Road / Main Street couplet. The project proposes 275 multi-family and 75 single family homes.
4. **Planning Area 12 Freeway Commercial** project site is located east of SR 125 and west of Eastlake Parkway, south of Olympic Parkway. The project proposes 900 multi-family homes, commercial, mixed use, hotel and park uses.
5. **Village 2** project site is located east of the Project site and west of La Media Road, south of Olympic Parkway. The project includes development of 4,538 residential units (614 single-family and 3,924 multi-family units) and three industrial areas within approximately 87.9 acres.
6. **Village 8 West** will be located in the southwest portion of Otay Ranch and will be developed around the future intersection of La Media Road and Main Street. The project will be built in several phases. The following components of the project were included in the Project' near-term cumulative analysis: 561 single family homes, 1,773 multi-family homes, 50,000 SF of office uses, 250,000 SF of commercial retail, an elementary school, and 23.4 acres of parks.
7. **Village 9** will be located east of SR 125 and south of the Millenia Project. Designated uses and density at buildout of the project include. 3,959 residential units: 266 SF units and 3,693 MF units; 1,200,000 SF Commercial/Office; 300,000 SF Retail; 5 Acres of CPF; 27.5 Acres of Parks; 19.8 Acres of School.

8. **Eastlake Behavioral Health Hospital** will be located at the terminus of the Showroom Place cul-de-sac, north of Fenton Street. The project proposes the development of a new 120-bed hospital.

**Figure 13–1** shows the Cumulative Projects only traffic volumes on the existing street network.

**TABLE 13-1**  
**CUMULATIVE PROJECTS SUMMARY**

<b>Project</b>	<b>Land Uses at Buildout</b>
<b>University Villages</b> , consisting of:	
Village 3	1,638 residential units: 813 SF units, 457 MF units, and 327 unallocated units; 20,000 SF Retail (7.4 Acres); 29.3 Acres of Industrial; 15.3 Acres of Parks; 4.3 Acres of CPF; 8.3 Acres of School.
Village 8 East	Base Scenario: 3,276 residential units: 943 SF units and 2,333 MF units; 20,000 SF Retail; 4.2 Acres of CPF; 30.4 (Required) Acres of Parks; 10.8 Acres of School. Per 2020 Amendment
Village 10	1,740 residential units: 695 SF units and 1,045 MF units; 7.6 Acres of Parks; 4.3 Acres of CPF; 9.2 Acres of School.
<b>Millenia</b>	2,983 multi-family residential units and 3.324 million square feet of non-residential uses, including regional and specialty shopping, multi-use cultural arts facilities, local parks, business parks, visitor commercial, a transit station, an elementary school, and other civic facilities.
Village 4	275 multi-family and 75 single family homes.
<b>PA12</b>	900 multi-family homes, commercial, mixed use, hotel and park uses.
Village 2	The project includes development of 4,538 residential units (614 single-family and 3,924 multi-family units) and three industrial areas within approximately 87.9 acres.
Village 8W	The following components of the project were included in the Project's near-term cumulative analysis: 561 single family homes, 1,773 multi-family homes, up to 50,000 SF of office uses and 250,000 SF of commercial retail, an elementary school, and 23.4 acres of parks
Village 9	3,959 residential units: 266 SF units and 3,693 MF units; 1,200,000 SF Commercial/Office; 300,000 SF Retail; 5 Acres of CPF; 27.5 Acres of Parks; 19.8 Acres of School.
<b>Eastlake Behavioral Health</b>	120 beds

## 14.0 ANALYSIS OF NEAR-TERM CONDITIONS

The following section presents the analysis of study area intersections and street segments under Near-Term conditions without and with the proposed Project.

### 14.1 Near-Term Traffic Volumes

Near-Term without Project traffic volumes were calculated by adding the cumulative projects traffic volumes onto the Existing traffic volumes. Near-Term + Project traffic volumes were calculated by then adding the Project traffic volumes.

**Figure 14-1** shows the Near-Term traffic volumes. **Figure 14-2** shows the Near-Term + Project traffic volumes.

### 14.2 Near-Term without Project Conditions

#### 14.2.1 Peak Hour Intersection Analysis

**Table 14-1** summarizes the peak hour intersection operations under Near-Term conditions in the study area. As shown, the study area intersections are calculated to operate acceptably at LOS D or better during the AM and PM peak hours, with the exception of the following:

- Olympic Parkway / I-805 Southbound Ramps (LOS E during the PM peak hour)
- Olympic Parkway / I-805 Northbound Ramps (LOS F during the AM and LOS E during the PM peak hours)
- Olympic Parkway / Brandywine Avenue (LOS F during the AM and PM peak hours)
- Olympic Parkway / Heritage Road (LOS F during the AM and PM peak hours)
- Olympic Parkway / La Media Road (LOS F during the AM and LOS E during the PM peak hours)

**Appendix D** contains the Near-Term intersection analysis worksheets.

#### 14.2.2 Daily Street Segment Operations

**Table 14-2** summarizes the Near-Term street segment operations along the key study area roadways. As shown, the study area street segments are calculated to operate acceptably at LOS C or better, with the exception of the following:

- Olympic Parkway: I-805 Ramps to Oleander Avenue (LOS F)
- Olympic Parkway: Oleander Avenue to Brandywine Avenue (LOS F)
- Olympic Parkway: Brandywine Avenue to Project Driveway (West) (LOS F)
- Olympic Parkway: Project Driveway (West) to Project Driveway (East) (LOS F)
- Olympic Parkway: Project Driveway (East) to Heritage Road (LOS F)
- Olympic Parkway: Heritage Road to Santa Venetia Street (LOS F)
- Olympic Parkway: Santa Venetia Street to La Media Road (LOS F)

## 14.3 Near-Term with Project Conditions

### 14.3.1 Peak Hour Intersection Analysis

Table 14–1 summarizes the peak hour intersection operations under Near-Term + Project conditions in the study area. As shown, the study area intersections are calculated to operate acceptably at LOS D or better during the AM and PM peak hours, with the exception of the following:

- Olympic Parkway / I-805 Southbound Ramps (LOS E during the PM peak hour)
- Olympic Parkway / I-805 Northbound Ramps (LOS F during the AM and PM peak hours)
- Olympic Parkway / Brandywine Avenue (LOS F during the AM and PM peak hours)
- Olympic Parkway / Heritage Road (LOS F during the AM and PM peak hours)
- Olympic Parkway / La Media Road (LOS F during the AM and LOS E during the PM peak hours)

The Project contributes less than 5% of traffic to the following locations. ***Therefore, the Project effects are considered substantial cumulative effects.***

- East Orange Avenue / I-805 Southbound Ramps
- Olympic Parkway / I-805 Northbound Ramps
- Olympic Parkway / Heritage Road
- Olympic Parkway / La Media Road

The Project contributes more than 5% of traffic to the following location. ***Therefore, the Project effects are considered substantial project specific effects.***

- Olympic Parkway / Brandywine Avenue

***Appendix E*** contains the Near-Term + Project intersection analysis worksheets.

### 14.3.2 Daily Street Segment Operations

Table 14–2 summarizes the Near-Term + Project street segment operations along the key study area roadways. As shown, the study area street segments are calculated to operate acceptably at LOS C or better, with the exception of the following:

- Olympic Parkway: I-805 Ramps to Oleander Avenue (LOS F)
- Olympic Parkway: Oleander Avenue to Brandywine Avenue (LOS F)
- Olympic Parkway: Brandywine Avenue to Project Driveway (West) (LOS F)
- Olympic Parkway: Project Driveway (West) to Project Driveway (East) (LOS F)
- Olympic Parkway: Project Driveway (East) to Heritage Road (LOS F)
- Olympic Parkway: Heritage Road to Santa Venetia Street (LOS F)
- Olympic Parkway: Santa Venetia Street to La Media Road (LOS F)

The Project contributes more than 800 ADT, but less than 5% of traffic to the following locations.

***Therefore, the Project effects are considered substantial cumulative effects.***

- Olympic Parkway: I-805 to Oleander Avenue
- Olympic Parkway: Oleander Avenue to Brandywine Avenue
- Olympic Parkway: Project Driveway (West) to Project Driveway (East)
- Olympic Parkway: Project Driveway (East) to Heritage Road
- Olympic Parkway: Heritage Road to Santa Venetia Street
- Olympic Parkway: Santa Venetia Street to La Media Road

The Project contributes more than 800 ADT and more than 5% of traffic to the following location.

***Therefore, the Project effects are considered substantial project specific effects.***

- Olympic Parkway: Brandywine Avenue to Project Driveway (West)

**TABLE 14-1**  
**NEAR-TERM INTERSECTION OPERATIONS**

Intersection	Control Type	Peak Hour	Near-Term		Near-Term with Project		Project % of Entering Volume (>5%)	Effect Type
			Delay <sup>a</sup>	LOS <sup>b</sup>	Delay	LOS		
1. Olympic Parkway / I-805 Southbound Ramps	Signal	AM	47.6	D	49.2	D	2.6%	<b>Cumulative</b>

b. Average Daily Traffic Volumes.

c. Level of Service.

## 15.0 ASSESSMENT OF YEAR 2035 CONDITIONS

The following section presents an assessment of the study area street segments under Year 2035 conditions. As noted earlier in this study, the Project site is currently zoned for industrial land uses and is assumed as such in the SANDAG model.

**Table 15-1** compares the trip generation calculations for the existing industrial land use zoning and the proposed residential project. As shown, the Project will generate 72 additional daily trips (1.3% more trips) and fewer peak hour trips as compared to the industrial zoning. Therefore, it can be concluded that the Project is included in the SANDAG Series 13 Year 2035 model.

**Table 15-2** summarizes the Year 2035 conditions street segment operations along the study area roadways. ADT traffic volumes were obtained directly from the SANDAG Series 13 Year 2035 Traffic Model. As shown, under Year 2035 conditions (which include the Project's anticipated trips) the study area street segments are calculated to operate acceptably at LOS C or better, with the exception of the following:

- Olympic Parkway: I-805 Ramps to Oleander Avenue (LOS E)
- Olympic Parkway: Oleander Avenue to Brandywine Avenue (LOS D)
- Olympic Parkway: Brandywine Avenue to Project Driveway (West) (LOS D)
- Olympic Parkway: Project Driveway (West) to Project Driveway (East) (LOS D)
- Olympic Parkway: Project Driveway (East) to Heritage Road (LOS D)

It should be noted that the majority Series 13 Year 2035 ADTs are lower than the Existing ADTs counted in January 2020. This is because the model assumes buildout of the City of Chula Vista General Plan Circulation Element, including the following network enhancements which are expected to reduce the number of trips on Olympic Parkway:

- Heritage Road from Olympic Parkway to Main Street as a 6-Lane Prime Arterial
- Extension of La Media Road from Santa Luna Street to Main Street
- Extension of Main Street from Heritage Road to East Lake Parkway including crossing at SR 125
- Otay Valley Road from Main Street to Village 9 including crossing at SR 125
- Construction of SR 125 Ramps at Main Street

The distribution of Project trips shown on *Figure 11-1* may change with the implementation of the Circulation Element network enhancements since drivers will be provided with additional travel routes. The Series 13 Year 2035 ADTs reflect any such changes to the distribution.

Since the Project does not generate more traffic than the currently zoned industrial land use, the Project would not contribute to substantial effects under Year 2035 conditions.

**TABLE 15-1**  
**TRIP GENERATION COMPARISON**

Use	Quantity	Daily Trip Ends (ADTS) <sup>a</sup>		AM Peak Hour				PM Peak Hour			
		Rate <sup>b</sup>	Volume	% of ADT	In:Out Split	Volume		% of ADT	In:Out Split	Volume	
<b>Current Zoning</b>											
Industrial	47.4 Acres	120 / Acre	5,688	14%	80:20	637	159	15%	30:70	256	597
<b>Proposed Project</b>											
Condominiums	720 Units	8 / Unit	5,760	8%	20:80	92	369	10%	70:30	403	173
<b><i>Increase / Decrease in Trips</i></b>		<b>72</b>		-		<b>-545</b>	<b>210</b>			<b>147</b>	<b>-424</b>

**Footnotes:**

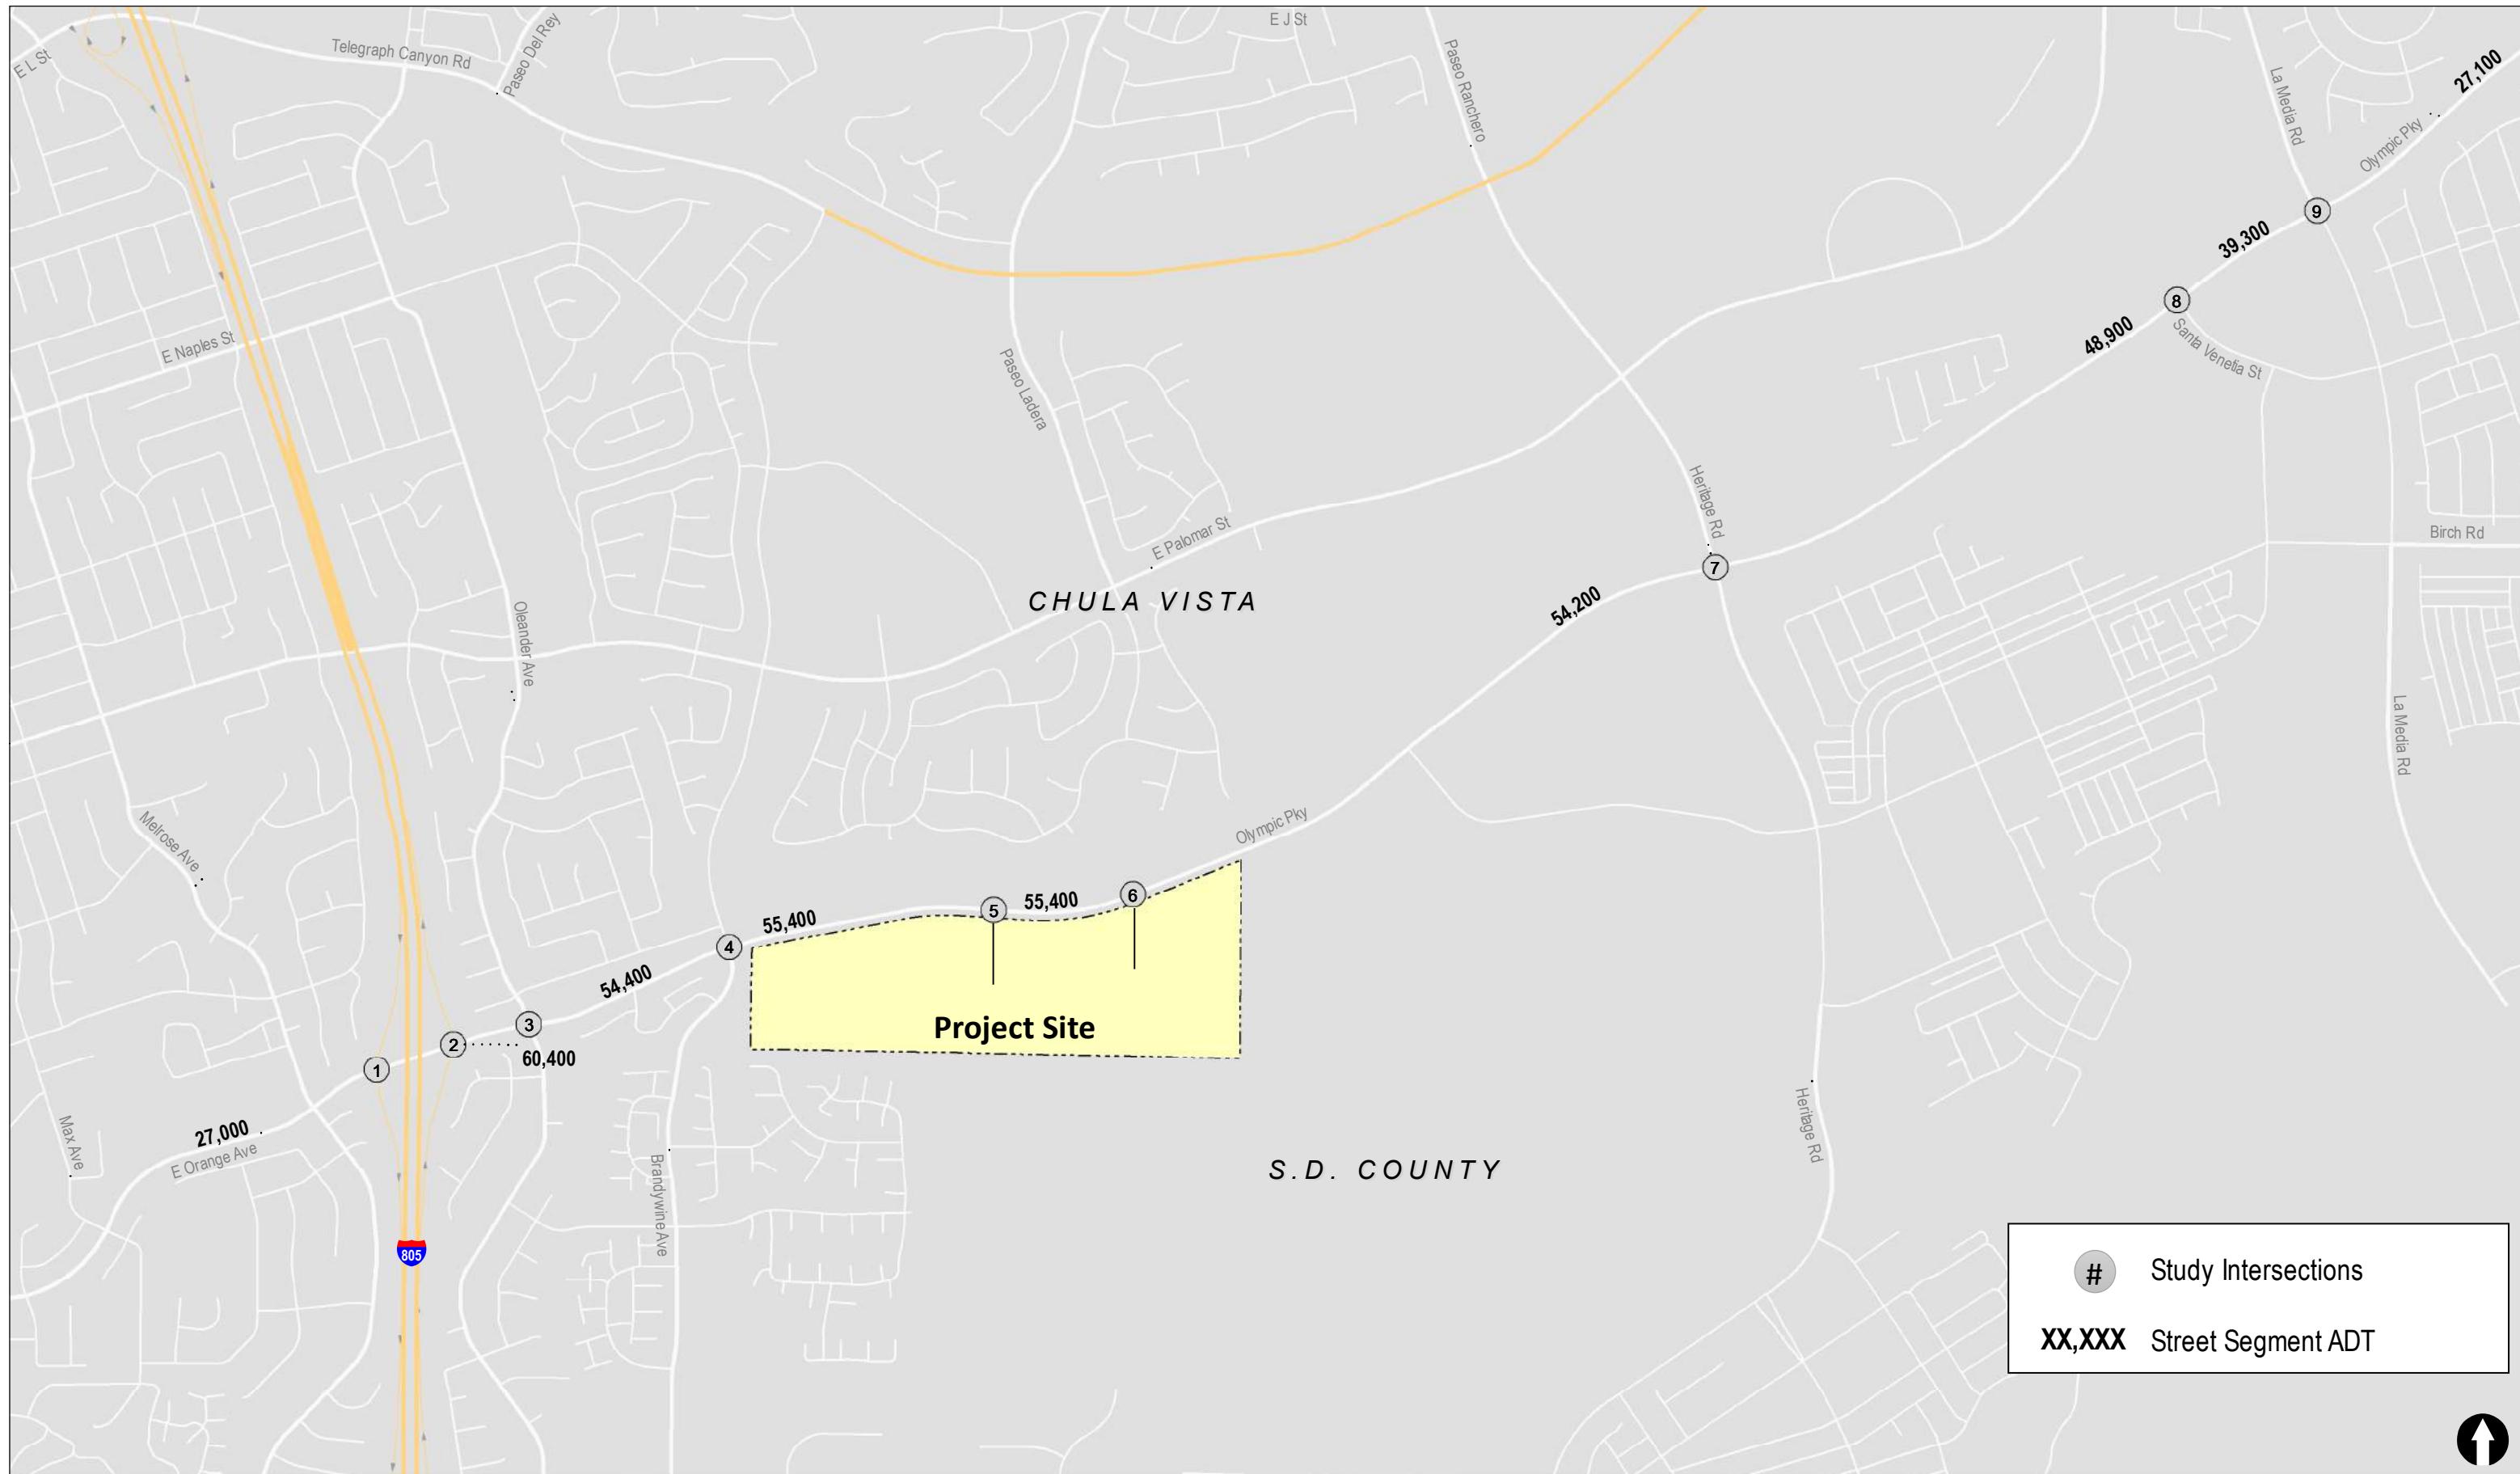

- d. Average Daily Trips
- e. Trip Generation Rate from the SANDAG's *Not So Brief Guide of Vehicular Traffic Generation Rates for the San Diego Region*, 2002.

**TABLE 15–2**  
**YEAR 2035 STREET SEGMENT OPERATIONS**

<b>Street Segment</b>	<b>Functional Classification</b>	<b>Capacity (LOS C)<sup>a</sup></b>	<b>Buildout (Year 2035)</b>	
			<b>ADT<sup>b</sup></b>	<b>LOS<sup>c</sup></b>
<b>Olympic Parkway</b>				
West of I-805 Ramps	4-Lane Major	30,000	27,000	C
I-805 Ramps to Oleander Avenue	6-Lane Prime	<b>50,000</b>	<b>60,400</b>	E
Oleander Avenue to Brandywine Avenue	6-Lane Prime	<b>50,000</b>	<b>54,400</b>	D
Brandywine Avenue to Project Driveway (West)	6-Lane Prime	<b>50,000</b>	<b>55,400</b>	D

La Media Road to Paloma Street	6-Lane Prime	50,000	27,100	A

**Footnotes:**

- a. Capacities based on City of Chula Vista Roadway Classification Table.
- b. Average Daily Traffic Volumes.
- c. Level of Service.

## 16.0 ACCESS ASSESSMENT

The Project site is located south of Olympic Parkway, between Brandywine Avenue and Heritage Road in the City of Chula Vista. Two signalized points of access to the site are planned from Olympic Parkway, in the locations designated in the 1998 Sunbow SPA Plan.

Peak Hour signal warrant analyses based on the warrants contained in Chapter 4C, “Traffic Control Signal Needs Studies,” of the *2014 California Manual on Uniform Traffic Control Devices, Revision 5* (CA MUTCD) were conducted for the Project’s proposed driveways to ensure signalization is warranted. The signal warrant calculations are provided in *Appendix H*, and show that both driveways meet the Peak Hour signal warrant.

As noted in *Sections 12 and 14* of this study, the Project’s signalized driveways are calculated to operate acceptably at LOS C or better. The recommended lane configurations at the Project’s signalized driveways are shown in *Figure 16-1*.

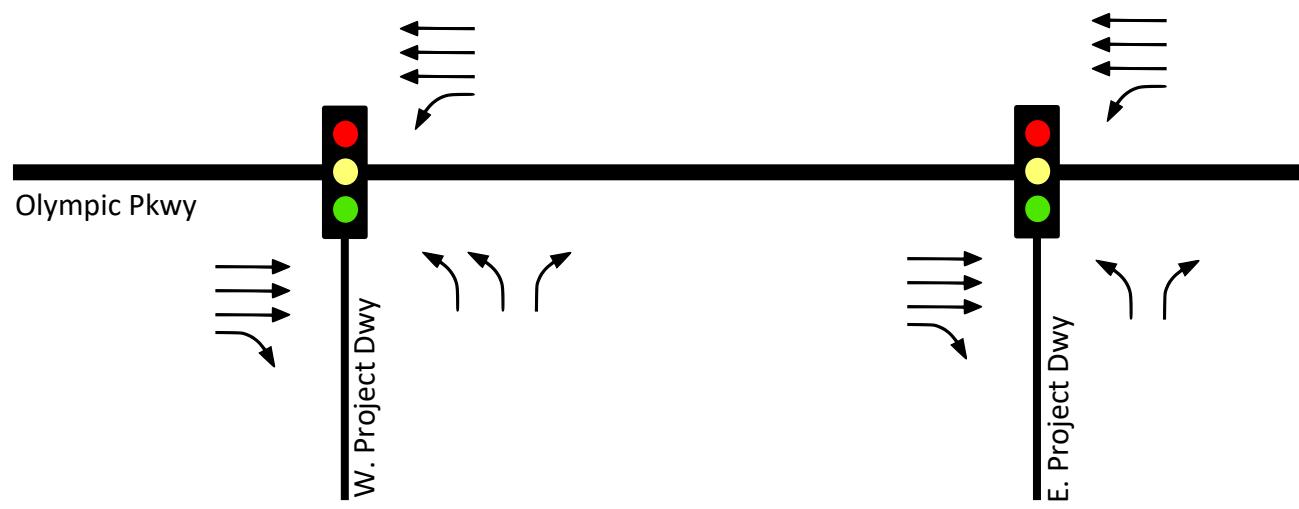

Figure 16-1

## Recommended Project Driveway Lane Configurations

Sunbow II, Phase 3

## 17.0 SUBSTANTIAL EFFECTS AND OPERATIONAL IMPROVEMENTS

The following section identifies Project-related substantial effects and recommends operational improvements to address the substantial effects.

### 17.1 Eastern Transportation Development Fee

City identified capital improvement projects are summarized in the published *Eastern Transportation Development Impact Fee* (“Eastern TDIF”) (September 2014). Additionally, City capital improvement projects include traffic signal upgrades for intersections in the study area published in the City of Chula Vista, *Traffic Signal Communications Master Plan Study* (July 2017). These two documents were referenced when identifying potential operational improvements to address Project-related effects.

### 17.2 Substantial Project Specific Effects and Operational Improvements

The Project is calculated to cause *substantial project specific effects* at the following locations:

- TRA 1: Intersection No. 4: Olympic Parkway / Brandywine Avenue: This intersection is built-out, and the provision of additional lanes is considered physically infeasible. Additionally, a review of the *Eastern Transportation Development Impact Fee* and the *Traffic Signal Communications Master Plan Study* indicate that there are currently no proposed physical operational improvements for this signalized intersection.

Payment of the City’s TDIF should be applied towards other planned network enhancements included in the Eastern TDIF study that would reduce traffic on Olympic Parkway. Large-scale network enhancements included in the Eastern TDIF, such as the extension of La Media Road and the extension of Main Street, are expected to reduce the number of trips on Olympic Parkway.

As discussed in *Section 15* this report, the majority of the ADTs on Olympic Parkway are lower under Year 2035 model conditions (which assumes buildout of the City’s General Plan Circulation Element and includes Project traffic) as compared to the Existing ADTs, counted in January 2020. *Table 17-1* shows that, on average, the Year 2035 traffic volumes are 6.1% lower as compared to the Existing ADTs, which supports the assertion that the contribution of TDIF funds towards other planned network enhancements included in the Eastern TDIF study will reduce the amount of traffic on Olympic Parkway, thereby addressing the Project’s substantial effect.

In addition, the Project will contribute its fair share contribution towards the provision of Adaptive Traffic Signal Control (ATSC) modules to each signalized intersection along the Olympic Parkway corridor between the I-805 Ramps and La Media Road.

**TABLE 17-1**  
**OLYMPIC PARKWAY ADT COMPARISON**

Street Segment	Existing (January 2020)	Year 2035	% Increase / Decrease from Existing
<b>Olympic Parkway</b>			
West of I-805 Ramps	25,060	27,000	7.7%
I-805 Ramps to Oleander Avenue	67,980	60,400	-11.2%
Oleander Avenue to Brandywine Avenue	56,800	54,400	-4.2%
Brandywine Avenue to Project Driveway (West)	54,820	55,400	1.1%
Project Driveway (West) to Project Driveway (East)	54,820	55,400	1.1%
Project Driveway (East) to Heritage Road	54,820	54,200	-1.1%
Heritage Road to Santa Venetia Street	53,680	48,900	-8.9%
Santa Venetia Street to La Media Road	47,610	39,300	-17.5%
La Media Road to Paloma Street	34,560	27,100	-21.6%
<i>Average Decrease in Traffic</i>			<b>-6.1%</b>

**Footnotes:**

a. Average Daily Traffic Volumes.

- **TRA 2: Olympic Parkway Segments: Oleander Avenue to Project Driveway (West):** Olympic Parkway is classified as a Prime Arterial in the City of Chula Vista Circulation Plan. Currently it is built as a 6-lane divided road with three lanes westbound and three lanes eastbound and a raised median. Therefore, Olympic Parkway is built-out, and the provision of additional lanes is considered physically infeasible and inconstant with the City's General Plan. Additionally, a review of the *Eastern Transportation Development Impact Fee* and the *Traffic Signal Communications Master Plan Study* indicate that there are currently no proposed physical operational improvements for this segment of Olympic Parkway.

Payment of the City's TDIF should be applied towards other planned network enhancements included in the Eastern TDIF study that would reduce traffic on Olympic Parkway. Large-scale network enhancements included in the Eastern TDIF, such as the extension of La Media Road and the extension of Main Street, are expected to reduce the number of trips on Olympic Parkway.

As discussed in *Section 15* this report, the majority of the ADTs on Olympic Parkway are lower under Year 2035 model conditions (which assumes buildout of the City's General Plan Circulation Element and includes Project traffic) as compared to the Existing ADTs, counted in January 2020. *Table 17-1* shows that, on average, the Year 2035 traffic volumes are 6.1% lower as compared to the Existing ADTs, which supports the assertion that the contribution of TDIF funds towards other planned network

enhancements included in the Eastern TDIF study will reduce the amount of traffic on Olympic Parkway, thereby addressing the Project's substantial effect.

In addition, the Project will contribute its fair share contribution towards the provision of Adaptive Traffic Signal Control (ATSC) modules to each signalized intersection along the Olympic Parkway corridor between the I-805 Ramps and La Media Road.

### 17.3 Substantial Cumulative Effects and Operational Improvements

The Project is calculated to cause ***substantial cumulative effects*** at the following locations:

- **TRA 3: Intersection No. 1: E. Orange Avenue / I-805 Southbound Ramps:** This intersection is built-out, and the provision of additional lanes is considered physically infeasible. Additionally, a review of the *Eastern Transportation Development Impact Fee* and the *Traffic Signal Communications Master Plan Study* indicate that there are currently no proposed physical operational improvements for this signalized intersection.

Payment of the City's TDIF should be applied towards other planned network enhancements included in the Eastern TDIF study that would reduce traffic on Olympic Parkway. Large-scale network enhancements included in the Eastern TDIF, such as the extension of La Media Road and the extension of Main Street, are expected to reduce the number of trips on Olympic Parkway.

As discussed in *Section 15* this report, the majority of the ADTs on Olympic Parkway are lower under Year 2035 model conditions (which assumes buildout of the City's General Plan Circulation Element and includes Project traffic) as compared to the Existing ADTs, counted in January 2020. *Table 17-1* shows that, on average, the Year 2035 traffic volumes are 6.1% lower as compared to the Existing ADTs, which supports the assertion that the contribution of TDIF funds towards other planned network enhancements included in the Eastern TDIF study will reduce the amount of traffic on Olympic Parkway, thereby addressing the Project's substantial effect.

In addition, the Project will contribute its fair share contribution towards the provision of Adaptive Traffic Signal Control (ATSC) modules to each signalized intersection along the Olympic Parkway corridor between the I-805 Ramps and La Media Road.

- **TRA 4: Intersection No. 2: Olympic Parkway / I-805 Northbound Ramps:** This intersection is built-out, and the provision of additional lanes is considered physically infeasible. Additionally, a review of the *Eastern Transportation Development Impact Fee* and the *Traffic Signal Communications Master Plan Study* indicate that there are currently no proposed physical operational improvements for this signalized intersection.

Payment of the City's TDIF should be applied towards other planned network enhancements included in the Eastern TDIF study that would reduce traffic on Olympic Parkway. Large-scale network enhancements included in the Eastern TDIF, such as the extension of La Media Road and the extension of Main Street, are expected to reduce the number of trips on Olympic Parkway.

As discussed in *Section 15* this report, the majority of the ADTs on Olympic Parkway are lower under Year 2035 model conditions (which assumes buildout of the City's General Plan Circulation Element and includes Project traffic) as compared to the Existing ADTs, counted in January 2020. *Table 17-1* shows that, on average, the Year 2035 traffic volumes are 6.1% lower as compared to the Existing ADTs, which supports the assertion that the contribution of TDIF funds towards other planned network enhancements included in the Eastern TDIF study will reduce the amount of traffic on Olympic Parkway, thereby addressing the Project's substantial effect.

In addition, the Project will contribute its fair share contribution towards the provision of Adaptive Traffic Signal Control (ATSC) modules to each signalized intersection along the Olympic Parkway corridor between the I-805 Ramps and La Media Road.

- **TRA 5: Intersection No. 7: Olympic Parkway / Heritage Road:** This intersection is built-out, and the provision of additional lanes is considered physically infeasible. Additionally, a review of the *Eastern Transportation Development Impact Fee* and the *Traffic Signal Communications Master Plan Study* indicate that there are currently no proposed physical operational improvements for this signalized intersection.

Payment of the City's TDIF should be applied towards other planned network enhancements included in the Eastern TDIF study that would reduce traffic on Olympic Parkway. Large-scale network enhancements included in the Eastern TDIF, such as the extension of La Media Road and the extension of Main Street, are expected to reduce the number of trips on Olympic Parkway.

As discussed in *Section 15* this report, the majority of the ADTs on Olympic Parkway are lower under Year 2035 model conditions (which assumes buildout of the City's General Plan Circulation Element and includes Project traffic) as compared to the Existing ADTs, counted in January 2020. *Table 17-1* shows that, on average, the Year 2035 traffic volumes are 6.1% lower as compared to the Existing ADTs, which supports the assertion that the contribution of TDIF funds towards other planned network enhancements included in the Eastern TDIF study will reduce the amount of traffic on Olympic Parkway, thereby addressing the Project's substantial effect.

In addition, the Project will contribute its fair share contribution towards the provision of Adaptive Traffic Signal Control (ATSC) modules to each signalized intersection along the Olympic Parkway corridor between the I-805 Ramps and La Media Road.

- **TRA 6: Intersection No. 9: Olympic Parkway / La Media Road:** This intersection is built-out, and the provision of additional lanes is considered physically infeasible. Additionally, a review of the *Eastern Transportation Development Impact Fee* and the *Traffic Signal Communications Master Plan Study* indicate that there are currently no proposed physical operational improvements for this signalized intersection.

Payment of the City's TDIF should be applied towards other planned network enhancements included in the Eastern TDIF study that would reduce traffic on Olympic Parkway. Large-scale network enhancements included in the Eastern TDIF, such as the

extension of La Media Road and the extension of Main Street, are expected to reduce the number of trips on Olympic Parkway.

As discussed in *Section 15* this report, the majority of the ADTs on Olympic Parkway are lower under Year 2035 model conditions (which assumes buildout of the City's General Plan Circulation Element and includes Project traffic) as compared to the Existing ADTs, counted in January 2020. *Table 17-1* shows that, on average, the Year 2035 traffic volumes are 6.1% lower as compared to the Existing ADTs, which supports the assertion that the contribution of TDIF funds towards other planned network enhancements included in the Eastern TDIF study will reduce the amount of traffic on Olympic Parkway, thereby addressing the Project's substantial effect.

In addition, the Project will contribute its fair share contribution towards the provision of Adaptive Traffic Signal Control (ATSC) modules to each signalized intersection along the Olympic Parkway corridor between the I-805 Ramps and La Media Road..

- TRA 7: Olympic Parkway Segments: I-805 Ramps to Oleander Avenue and Project Driveway (West) to La Media Road: Olympic Parkway is classified as a Prime Arterial in the City of Chula Vista Circulation Plan. Currently it is built as a 6-lane divided road with three lanes westbound and three lanes eastbound and a raised median. Therefore, Olympic Parkway is built-out, and the provision of additional lanes is considered physically infeasible and inconstant with the City's General Plan. Additionally, a review of the *Eastern Transportation Development Impact Fee* and the *Traffic Signal Communications Master Plan Study* indicate that there are currently no proposed physical operational improvements for this segment of Olympic Parkway.

Payment of the City's TDIF should be applied towards other planned network enhancements included in the Eastern TDIF study that would reduce traffic on Olympic Parkway. Large-scale network enhancements included in the Eastern TDIF, such as the extension of La Media Road and the extension of Main Street, are expected to reduce the number of trips on Olympic Parkway.

As discussed in *Section 15* this report, the majority of the ADTs on Olympic Parkway are lower under Year 2035 model conditions (which assumes buildout of the City's General Plan Circulation Element and includes Project traffic) as compared to the Existing ADTs, counted in January 2020. *Table 17-1* shows that, on average, the Year 2035 traffic volumes are 6.1% lower as compared to the Existing ADTs, which supports the assertion that the contribution of TDIF funds towards other planned network enhancements included in the Eastern TDIF study will reduce the amount of traffic on Olympic Parkway, thereby addressing the Project's substantial effect.

In addition, the Project will contribute its fair share contribution towards the provision of Adaptive Traffic Signal Control (ATSC) modules to each signalized intersection along the Olympic Parkway corridor between the I-805 Ramps and La Media Road.

## Intersection Summary

HCM 6th Ctrl Delay	31.6
HCM 6th LOS	C

## Notes

User approved volume balancing among the lanes for turning movement.

\* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

## Intersection Summary

HCM 6th Ctrl Delay 115.2

HCM 6th LOS F

## Notes

User approved volume balancing among the lanes for turning movement.

\* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

## Intersection Summary

HCM 6th Ctrl Delay 140.5

HCM 6th LOS F

## Notes

User approved volume balancing among the lanes for turning movement.

\* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

MP# LU-1.5 & LU-2.1.8

**LUT-1**

**Land Use / Location**

## Inputs:

The following information needs to be provided by the Project Applicant:

- Number of housing units per acre or jobs per job acre

## Mitigation Method:

$$\% \text{ VMT Reduction} = A * B [\text{not to exceed } 30\%]$$

Where:

A = Percentage increase in housing units per acre or jobs per job acre<sup>33</sup> = (number of housing units per acre or jobs per job acre – number of housing units per acre or jobs per job acre for typical ITE development) / (number of housing units per acre or jobs per job acre for typical ITE development) For small and medium sites (less than ½ mile in radius) the calculation of housing and jobs per acre should be performed for the development site as a whole, so that the analysis does not erroneously attribute trip reduction benefits to measures that simply shift jobs and housing within the site with no overall increase in site density. For larger sites, the analysis should address the development as several ½-mile-radius sites, so that shifts from one area to another would increase the density of the receiving area but reduce the density of the donating area, resulting in trip generation rate decreases and increases, respectively, which cancel one another.

B = Elasticity of VMT with respect to density (from literature)

## Detail:

- A: [not to exceed 500% increase]
  - If housing: (Number of housing units per acre – 7.6) / 7.6  
(See Appendix C for detail)
  - If jobs: (Number of jobs per acre – 20) / 20  
(See Appendix C for detail)
- B: 0.07 (Boarnet and Handy 2010)

## Assumptions:

Data based upon the following references:

- Boarnet, Marlon and Handy, Susan. 2010. “DRAFT Policy Brief on the Impacts of Residential Density Based on a Review of the Empirical Literature.” <http://arb.ca.gov/cc/sb375/policies/policies.htm>; Table 1.

<sup>33</sup> This value should be checked first to see if it exceeds 500% in which case A = 500%.

# Transportation

CEQA# MM D-1 & D-4  
MP# LU-1.5 & LU-2.1.8

LUT-1

Land Use / Location

## Emission Reduction Ranges and Variables:

Pollutant	Category Emissions Reductions <sup>34</sup>
CO <sub>2</sub> e	1.5-30% of running
PM	1.5-30% of running
CO	1.5-30% of running
NOx	1.5-30% of running
SO <sub>2</sub>	1.5-30% of running
ROG	0.9-18% of total

## Discussion:

The VMT reductions for this strategy are based on changes in density versus the typical suburban residential and employment densities in North America (referred to as “ITE densities”). These densities are used as a baseline to mirror those densities reflected in the ITE Trip Generation Manual, which is the baseline method for determining VMT.

There are two separate maxima noted in the fact sheet: a cap of 500% on the allowable percentage increase of housing units or jobs per acre (variable A) and a cap of 30% on % VMT reduction. The rationale for the 500% cap is that there are diminishing returns to any change in environment. For example, it is reasonably doubtful that increasing residential density by a factor of six instead of five would produce any additional change in travel behavior. The purpose for the 30% cap is to limit the influence of any single environmental factor (such as density). This emphasizes that community designs that implement multiple land use strategies (such as density, design, diversity, etc.) will show more of a reduction than relying on improvements from a single land use factor.

## Example:

Sample calculations are provided below for housing:

$$\begin{aligned} \text{Low Range \% VMT Reduction (8.5 housing units per acre)} \\ = (8.5 - 7.6) / 7.6 * 0.07 = 0.8\% \end{aligned}$$

$$\text{High Range \% VMT Reduction (60 housing units per acre)}$$

$$= \frac{60 - 7.6}{7.6} = 6.9 \text{ or } 690\% \text{ Since greater than 500%, set to 500\%}$$

$$= 500\% \times 0.07 = 0.35 \text{ or } 35\% \text{ Since greater than 30\%, set to 30\%}$$

<sup>34</sup> The percentage reduction reflects emission reductions from running emissions. The actual value will be less than this when starting and evaporative emissions are factored into the analysis. ROG emissions have been adjusted to reflect a ratio of 40% evaporative and 60% exhaust emissions based on a statewide EMFAC run of all vehicles.

# Transportation

CEQA# MM D-1 & D-4  
MP# LU-1.5 & LU-2.1.8

LUT-1

Land Use / Location

Sample calculations are provided below for jobs:

Low Range % VMT Reduction (25 jobs per acre)  
 $= (25 - 20) / 20 * 0.12 = 3\%$

High Range % VMT Reduction (100 jobs per acre)  
 $= \frac{100 - 20}{20} = 4 \text{ or } 400\%$   
 $= 400\% \times 0.12 = 0.48 \text{ or } 48\% \text{ Since greater than } 30\%, \text{ set to } 30\%$

## Preferred Literature:

- $-0.07 = \text{elasticity of VMT with respect to density}$

Boarnet and Handy's detailed review of existing literature highlighted three individual studies that used the best available methods for analyzing data for individual households. These studies provided the following elasticities: -0.12 - Brownstone (2009), -0.07 – Bento (2005), and -0.08 – Fang (2008). To maintain a conservative estimate of the impacts of this strategy, the lower elasticity of -0.07 is used in the calculations.

## Alternative Literature:

- $-0.05 \text{ to } -0.25 = \text{elasticity of VMT with respect to density}$

The *TRB Special Report 298* literature suggests that doubling neighborhood density across a metropolitan area might lower household VMT by about 5 to 12 percent, and perhaps by as much as 25 percent, if coupled with higher employment concentrations, significant public transit improvements, mixed uses, and other supportive demand management measures.
